Denver, CO 80202

**Re: Third and Fourth Quarters 2008 Groundwater Monitoring and Remediation Status Report for the DCP Midstream Spindle Gas Plant, Fort Lupton, CO**

Dear Mr. Cole:

Cordilleran Compliance Services, Inc. (Cordilleran) has completed groundwater monitoring for the third and fourth quarters of 2008, at the DCP Midstream Spindle Gas Plant (Plant), which is located at 9101 Weld County Road 14, Fort Lupton, Colorado. This report discusses the field activities, results of groundwater monitoring, and remediation status for the last two quarters of 2008. The locations of the monitoring wells, piezometers, the Northeast (NE) remediation and Southwest (SW) remediation systems are shown in Figure 1.

Groundwater samples and fluid level measurements were collected from monitoring wells and piezometers in August 2008 (Third Quarter) and November 2008 (Fourth Quarter). The air sparge systems for the northeast and southwest areas of the plant were operated throughout this period with minimal down time.

**Groundwater Monitoring**

For the monitoring, fluid levels were measured from all existing monitoring wells and piezometers. Groundwater samples were collected from selected wells with fluid level measurements obtained prior to the removal of three casing volumes using weighted disposable bailers. Temperature and pH were obtained immediately prior to sampling each well. All samples were placed into laboratory provided containers, stored on ice, and submitted to ACCUTEST Laboratories, Houston, Texas following chain-of-custody protocol. All samples were analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8021B.

**Site Hydrogeology**

Groundwater levels for the August 2008 monitoring period were the highest for the year and were encountered at near surface at MW-1 (southwest area) to 7.76 feet below ground surface at MW-35 (northeast area). Groundwater levels in November were lower than in August and varied from 2.87 feet below ground surface at MW-2 to 7.58 feet below ground surface at MW-37. In general, the groundwater levels during these monitoring periods were higher than in other monitoring periods and only slightly lower than the high groundwater observed during 2007. For August and November, the direction of groundwater flow across most of the site is towards the east and northeast (the regional groundwater flow direction) with an average gradient across the site of 0.013 feet per foot (ft/ft) in August and in November 0.014 ft/ft which are similar to previously measured gradients. The groundwater elevation high is west of the plant near MW-27, and the groundwater low is located east of the plant near MW-44 (Figures 2 and 3).

A minor southwesterly groundwater flow observed during previous monitoring periods is still apparent in the area (Figures 2 and 3). The measured gradient in August in this area was 0.012 ft/ft and 0.014 ft/ft in November which are similar to previously measured gradients in this area of the site.

A summary of the 2008 groundwater elevations is presented in Table 1. Historical groundwater measurements are presented in Attachment 1.

### **Phase Separated Hydrocarbons Observations**

Historical phase separated hydrocarbons (PSH) occurrences at the Plant were observed in the north-northeast and the southwest areas. During this monitoring period, PSH continues to not be detected in any wells or piezometers on site and has not been detected on the Plant since 2005. The historical PSH measurements are presented in Attachment 1.

### **Groundwater Quality Results**

The semi-annual sample list of monitoring wells was used for the third quarter monitoring period (August) and the quarterly sampling list was used for the fourth quarter sampling (November), based on the March 2004 agreement with the Colorado Oil and Gas Conservation Commission (COGCC). Forty-one (41) monitoring wells were sampled in August and 37 monitoring wells were sampled in November. In addition, two duplicate samples were acquired and submitted for analyses during both sampling periods. A summary of the laboratory results for this reporting period is presented in Table 1. The historical analytical results are presented in Attachment 2. The laboratory analytical reports for this reporting period, including the quality assurance/quality control data and the chain-of-custody records, are presented in Attachment 3. Attachment 4 contains monitoring well hydrographs verses benzene concentration for each monitoring well. Figure 4 shows the extent of the benzene concentration as detected at the Plant in August 2008 and Figure 5 shows the extent of benzene concentration at the Plant in November 2008.

The benzene concentrations in the area of the Plant showed similar concentrations in August and November as previously observed in the area. The highest concentrations of benzene are found in the areas of the Plant where significant amounts of PSH historically have been found on groundwater. The higher concentrations (greater than 5.0 mg/L) of benzene are generally located upgradient of the northeast and southwest systems. In general, the lower concentrations (less than 0.005 mg/L) of benzene are found downgradient of the southwest and northeast systems, upgradient or west of the Plant and off site, east and southwest of the Plant (Figures 4 and 5).

The point-of-compliance (POC) well, MW-39, located in the area downgradient of the southwest corner of the Plant and the POC well, MW-44, located in the area downgradient and northeast of the Plant, continue to show no detections of benzene above the lower method detection limit of 0.0005 mg/L. In August, a total of 10 monitoring wells showed benzene concentrations above the standard of 0.005 mg/L and in November a total of 12 were above the standard (Table 1). The number of wells with detections above the standard in August is lower than previously observed, but can be attributed to higher than normal groundwater levels. All of these wells are located on the property.

### **Northeast System Status**

The NE remediation system consists of a series of five air sparge trenches and is operated 24 hours per day. Daily status faxes are sent to the Cordilleran office from the system. Site visits to the system are performed monthly to optimize the system as needed and to do system maintenance. The system was operated during this reporting period with minimal down time. In the area of the system, benzene concentrations continue to show a reduction from the upgradient side to the downgradient side of the system.

### **Southwest System Status**

The SW remediation system consists of a groundwater barrier/slurry wall and air sparging. There are four gates in the slurry wall that allow groundwater to move through the wall. As the groundwater moves through the wall it is treated by air sparging. On each side of these gates, a monitoring well is located to monitor water quality before air treatment (Monitoring wells P1B, MW5, P3B, and P4B) and after air treatment (P1A, P2A, P3A and P4A).

The air treatment system was operated 12 hours per day with minimal down time, except during periods of repairs. For this reporting period, monthly routine maintenance was performed on the system and air lines and erosion problems were repaired around each gate.

The eight monitoring wells used to monitor system effectiveness were sampled during the August and November monitoring periods. The results are summarized in Table 1. The results indicate a reduction in BTEX concentrations from the before treatment side to the after treatment side of the system.

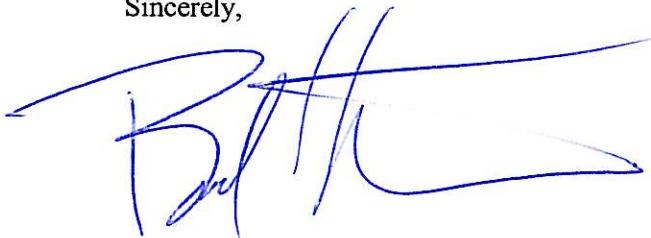

### **Discussion**

PSH has continued to not be found in any wells throughout the Plant and has not been found in any wells or piezometers since 2005.

Generally, the monitoring wells with highest concentrations of benzene are located in the area upgradient of the southwest system and in the area upgradient from the northeast system (Figures 4 and 5). The concentrations of benzene detected during this period were consistent with other reporting periods and did not show any significant increases from flushing that may be expected from the high groundwater levels that occurred in 2007. The POC monitoring wells, located in the northeast and southwest downgradient areas of the Plant, continue to show benzene concentrations less than the groundwater standard of 0.005 mg/L.

The impacts identified on the northeast and southwest corners of the Plant will continue to be addressed with the remediation systems to reduce groundwater impacts at the Plant boundaries. Cordilleran will continue to monitor groundwater and system performance at the site. The results of these activities will continue to be reported on a semi-annual basis.

Sincerely,

Brad Stephenson, P.G.  
Associate Hydrogeologist

## Technical Report for

### Cordilleran Compliance Services

#### Spindle Gas Plant

**Accutest Job Number:** T23498

**Sampling Date:** 08/19/08

#### Report to:

**Cordilleran Compliance Services**  
4690 Table Mountain Dr. Suite 200  
Golden, CO 80403  
[bradstephenson@cordcomp.com](mailto:bradstephenson@cordcomp.com)

**ATTN:** Brad Stephenson

**Total number of pages in report:** 47

Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or state specific certification programs as applicable.

*Paul K Canevaro*

**Paul Canevaro**  
Laboratory Director

**Client Service contact:** Sylvia Garza 713-271-4700

Certifications: TX (T104704220-06-TX) AR (88-0756) FL (E87628) KS (E-10366) LA (85695/04004)  
OK (9103) UT (7132714700)

This report shall not be reproduced, except in its entirety, without the written approval of Accutest Laboratories.  
Test results relate only to samples analyzed.

**Report of Analysis**

Page 1 of 1

<b>Client Sample ID:</b>	MW2	<b>Date Sampled:</b>	08/19/08
<b>Lab Sample ID:</b>	T23498-1	<b>Date Received:</b>	08/20/08
<b>Matrix:</b>	AQ - Ground Water	<b>Percent Solids:</b>	n/a
<b>Method:</b>	SW846 8021B		
<b>Project:</b>	Spindle Gas Plant		
Run #1 <sup>a</sup>	File ID CD084684.D	DF 100	Analyzed 08/29/08
Run #2			By AFL
			Prep Date n/a
			Prep Batch n/a
			Analytical Batch F:GCD3559
<b>Purge Volume</b>			
Run #1	5.0 ml		
Run #2			

**Purgeable Aromatics**

CAS No.	Compound	Result	RL	MDL	Units	Q
71-43-2	Benzene	5240	100	50	ug/l	
108-88-3	Toluene	ND	100	50	ug/l	
100-41-4	Ethylbenzene	ND	100	50	ug/l	
1330-20-7	Xylenes (total)	114	300	100	ug/l	J

CAS No.	Surrogate Recoveries	Run# 1	Run# 2	Limits
460-00-4	4-Bromofluorobenzene	94%		70-120%
98-08-8	aaa-Trifluorotoluene	94%		73-118%

(a) Sample was not preserved to a pH < 2; reported results are considered minimum values. Confirmed by dual column analysis. Analysis performed at Accutest Laboratories, Orlando, FL.

ND = Not detected      MDL - Method Detection Limit  
 RL = Reporting Limit  
 E = Indicates value exceeds calibration range

J = Indicates an estimated value  
 B = Indicates analyte found in associated method blank  
 N = Indicates presumptive evidence of a compound
