RE: Noble Energy Boulter G14-19 and G14-29 Drill Sites Wetland Delineation

Dear Mr. Rodine:

Savage and Savage conducted a wetland delineation at the Boulter G14-19 and G14-29 proposed drill sites on August 9, 2010. The proposed well sites are located in a pasture south of Weld County Road 46 and east of Weld County Road 45 in Weld County, Colorado. The site lies within the NW $\frac{1}{4}$ NW $\frac{1}{4}$ of Section 14, Township 4 North, Range 65 West of the 6th Prime Meridian, Weld County, Colorado.

Based on the proposed locations of the wells, these sites are constrained by the presence of wetlands. The pasture to the immediate east of the area investigated is topographically elevated (and owned by Mr. Boulter) and there is only a small area of wetlands at the southwest corner of this fenced pasture. If this pasture is within the drilling window, there should be no constraints due to wetlands.

Sincerely,

A handwritten signature in black ink, appearing to read "Michael S. Savage". The signature is stylized with a long, sweeping underline.

Michael S. Savage
Principal

U.S. Army Corps of Engineers Great Plains – Interim Version Data Sheets

INTRODUCTION

Savage and Savage conducted a wetland delineation within the area proposed for drilling the Boulter G14-19 and G14-29 wells for Noble Energy Production, Inc. on August 9, 2010. The proposed well sites are located in a pasture south of Weld County Road 46 and east of Weld County Road 45 in Weld County, Colorado (Figure 1.). From Denver, the site is accessed by traveling north on U.S. Highway 85 to Weld County Road 44, east on Weld County Road 44 for six miles to Weld County Road 45, then north on Weld County Road 45 for one mile to Weld County Road 46. The proposed drill sites are located approximately 0.3 miles east of the intersection, to the south in the pasture. The latitude of the center of the project site is 40.3185 degrees North and longitude is 104.635 degrees West. The average elevation of the project site is 4690 feet. The site lies within the NW¼NW¼ of Section 14, Township 4 North, Range 65 West of the 6th Prime Meridian, Weld County, Colorado.

STUDY METHODS

A wetland delineation was conducted within the proposed drill site windows in accordance with the requirements of the U.S. Army Corps of Engineers Wetlands Delineation Manual and Interim Supplement (USACE, 1987, 2008). To determine the areas subject to Corps jurisdiction, three criteria were evaluated: (1) evidence of a hydrologic regime reflecting saturation or periodic inundation by surface or ground water of sufficient duration and frequency, (2) soils which are considered hydric by classification or field characteristics indicating anaerobic conditions, and (3) a prevalence of vegetation typically adapted to areas of wetland hydrology and soils.

At four sample points within the pasture the three wetland criteria were evaluated. Dominant individual plant species were identified, and their wetland indicator status was assessed (USFWS, 1988). Evidence of the hydrologic regime was collected and evaluated. Soil test pits were dug using a core auger to at least 20 inches. Soil horizons were inspected and described using texture, soil color (Munsell, 1992), and moisture.

Two soils map units are found in the area of the proposed drill sites. According to the Soil Survey of Weld County, Southern Part, aquoll and aquept soils (map unit 4) are located within and immediately adjacent to the broad swale. This map unit is found within depressions in smooth plains and along the bottoms of natural drainageways throughout Weld County. They are deep, poorly drained soils that have formed in recent alluvium. Aquolls have a dark colored surface layer and make up about 55 percent of the unit. Aquepts, which make up about 25 percent of the soil unit, have a lighter colored surface layer. Surface layers are often yellowish brown silty clay, underlain by silty clay. About 20 percent are soils that are well drained and soils that have sandstone or shale within 48 inches of the surface. Aquoll and aquept soils are defined by the U.S. Army Corps of Engineers as hydric. On-site observation of soils at sample points 001, 002, and 004 within the swale of the project area confirmed the presence of this map unit.

The soil map unit above the perimeters of the broad swale consists of Valent sand (map unit 70) (USDA, 1980). This map unit is a deep, excessively drained soil formed in aeolian deposits on the plains. Typically, the surface layer of Valent soil is brown sand about six inches thick. The underlying material is brown sand to sixty inches. This soil unit is not defined as a hydric soil by the U.S. Army Corps of Engineers Wetlands Delineation Manual (USACE, 1987). Sample point 003 contained soil similar in character to the Valent sand, yet still exhibiting some transitional characteristics of the adjacent aquoll and aquept soils.

Vegetation within the project area was dominated by inland saltgrass, meadow foxtail, three-square, and clover. The first three species are considered indicative of hydrophytic or wetland conditions (Figure 2). Vegetation immediately adjacent to the swale, and outside the influence of seasonal ground and surface water, contained a mix of inland saltgrass and mesic and xeric pasture species including western wheatgrass and Rocky Mountain beeplant.

RESULTS/CONCLUSION

Savage and Savage conducted a wetland delineation within the area proposed for drilling the Boulter G14-19 and G14-29 wells for Noble Energy Production, Inc. on August 9, 2010. This delineation was conducted in order to determine the presence and extent of wetlands in and adjacent to the proposed drill sites, access road, and any ancillary sites.

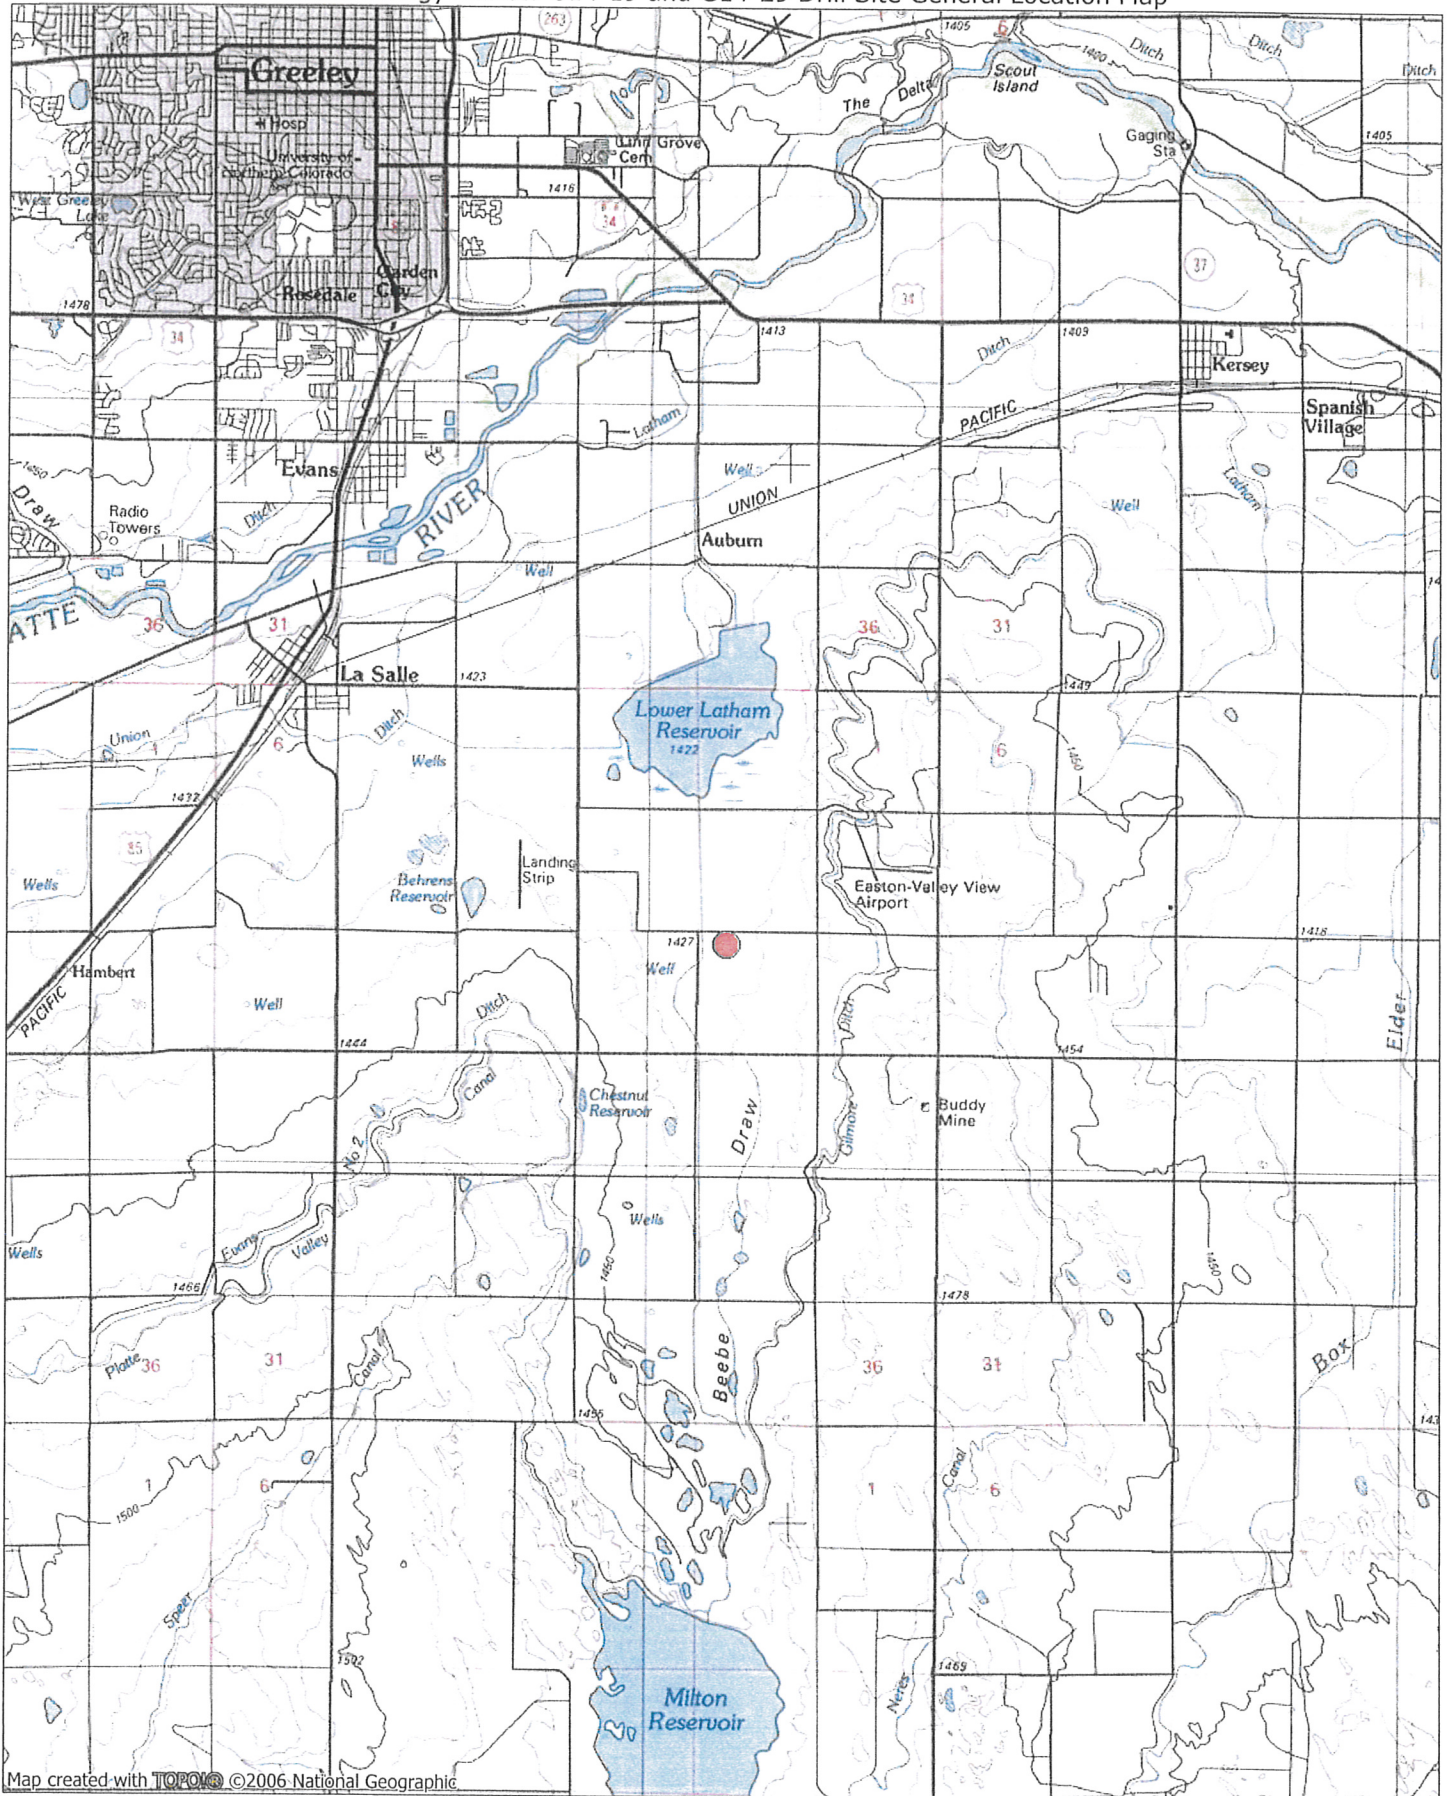

The entire broad swale was determined to contain wetlands extending to and slightly up the slopes at the perimeter of the broad swale. Except for areas where the topography was elevated by at least 0.75 feet (predominantly the east and south perimeters of the pasture, and a small area immediately south of Weld County Road 46 in the center of the project area), the project site was concluded to be wetlands as defined by the Corps of Engineers. The proposed locations for the drill sites were within the boundaries of wetlands. The project boundaries of the wetlands are identified on Figure 3.
