Hello Judy,

According to our records, the Great Plains 21-22V was drilled to 2090' with casing run to 2060' back in August of 2005. The PBTB for this well after cement was drilled out is that same depth, 2060', from that September. Our logs support this information, because the Trinidad Formation starts at 1966'. The well was never drilled to access the deep zone shown on the original Form 5A (2223-26'), and it is clearly wrong because anything below 2200' would be deep in the Trinidad and not worth targeting in this well. Our Petra database also doesn't have the deep perfs included.

Let me know if I can help further!

Josh
