Rod:

I have attached a Material Safety Data Sheet for field grade natural gas, the primary commodity transported in the gathering system that was undergoing construction activity near your home. To date no other substances have been identified as released during the pipeline construction activity. At COGCC's request, Anadarko has agreed to provide a thorough description of the construction activities, including how any liquids present in the pipeline were handled. They are also continuing to explore whether any chemicals, such as corrosion inhibitors, were added to the pipeline at any time during the construction procedures. They expect to be able to provide this information to us early next week and we will pass along to you.

Regards,

Matt
