Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

The night operator discovered produced water leaking from a corrosion hole in the temporary produced water tank. Approximately 15 bbls of produced water were released within the containment berm. A vacuum truck was used to remove the remaining produced water from the leaking tank and recovered approximately 10 bbls of standing produced water from within the containment berm. The impacted soil will be excavated. Confirmation soil samples will be collected from the excavation. The analytical results and excavation details will be provided in a supplemental report. A topographic Site Location Map showing the general location of the release is attached as Figure 1.
