

## Introduction

Encana Oil & Gas (USA) Inc. (Encana) is submitting this Form 4 Sundry Notice to request final closure status for an earthen pit associated with Foundation Creek B 7407 (COGCC facility #322343, COGCC remediation #5295). The pit was investigated, characterized and sampled by third party consultant as authorized by Encana personnel. All samples were collected in accordance with Encana's Environmental Compliance Group's Sampling Procedures. The analytical results for the respective soil samples were within the COGCC Table 910-1 standards and are provided in Table 1 and Attachment A of this submittal. The text below provides the details of the site investigation. For a visual description of the site investigation please refer to Figures 1 and 2 – Site Maps.

## Site Investigation

October 2010 – The pit was delineated and characterized using a PetroFlag field unit by a third party consultant. The excavated soil was in exceedance of the COGCC Table 910-1 standards with regards to the total petroleum hydrocarbon standard (2293 ppm). As such, the soil was treated with a bioremediation product and returned to the point of origin for later assessment.

June 14, 2011 – The pit was characterized utilizing a photoionization (PID) meter, and the use of a trackhoe. Field screen readings were collected throughout the excavation process. There were minimal indicators of hydrocarbon impacts to the soil; the highest reading was 17 ppm. Excavation continued until there were no indicators of hydrocarbon impacts. Grab samples were collected and submitted to the analytical laboratory for analysis. The stockpiled soil was backfilled and compacted into the excavation. Five (5) background samples were collected from up gradient of the excavation site from a depth of approximately one (1) foot. These samples were sent the lab for analysis with respect to arsenic. The excavated soil was stockpiled on location until the analytical laboratory report confirmed that the soil was within the COGCC Table 910-1 standards. The soil was backfilled and compacted upon receiving confirmation that the soil was within the Table 910-1 standards.

## Conclusion

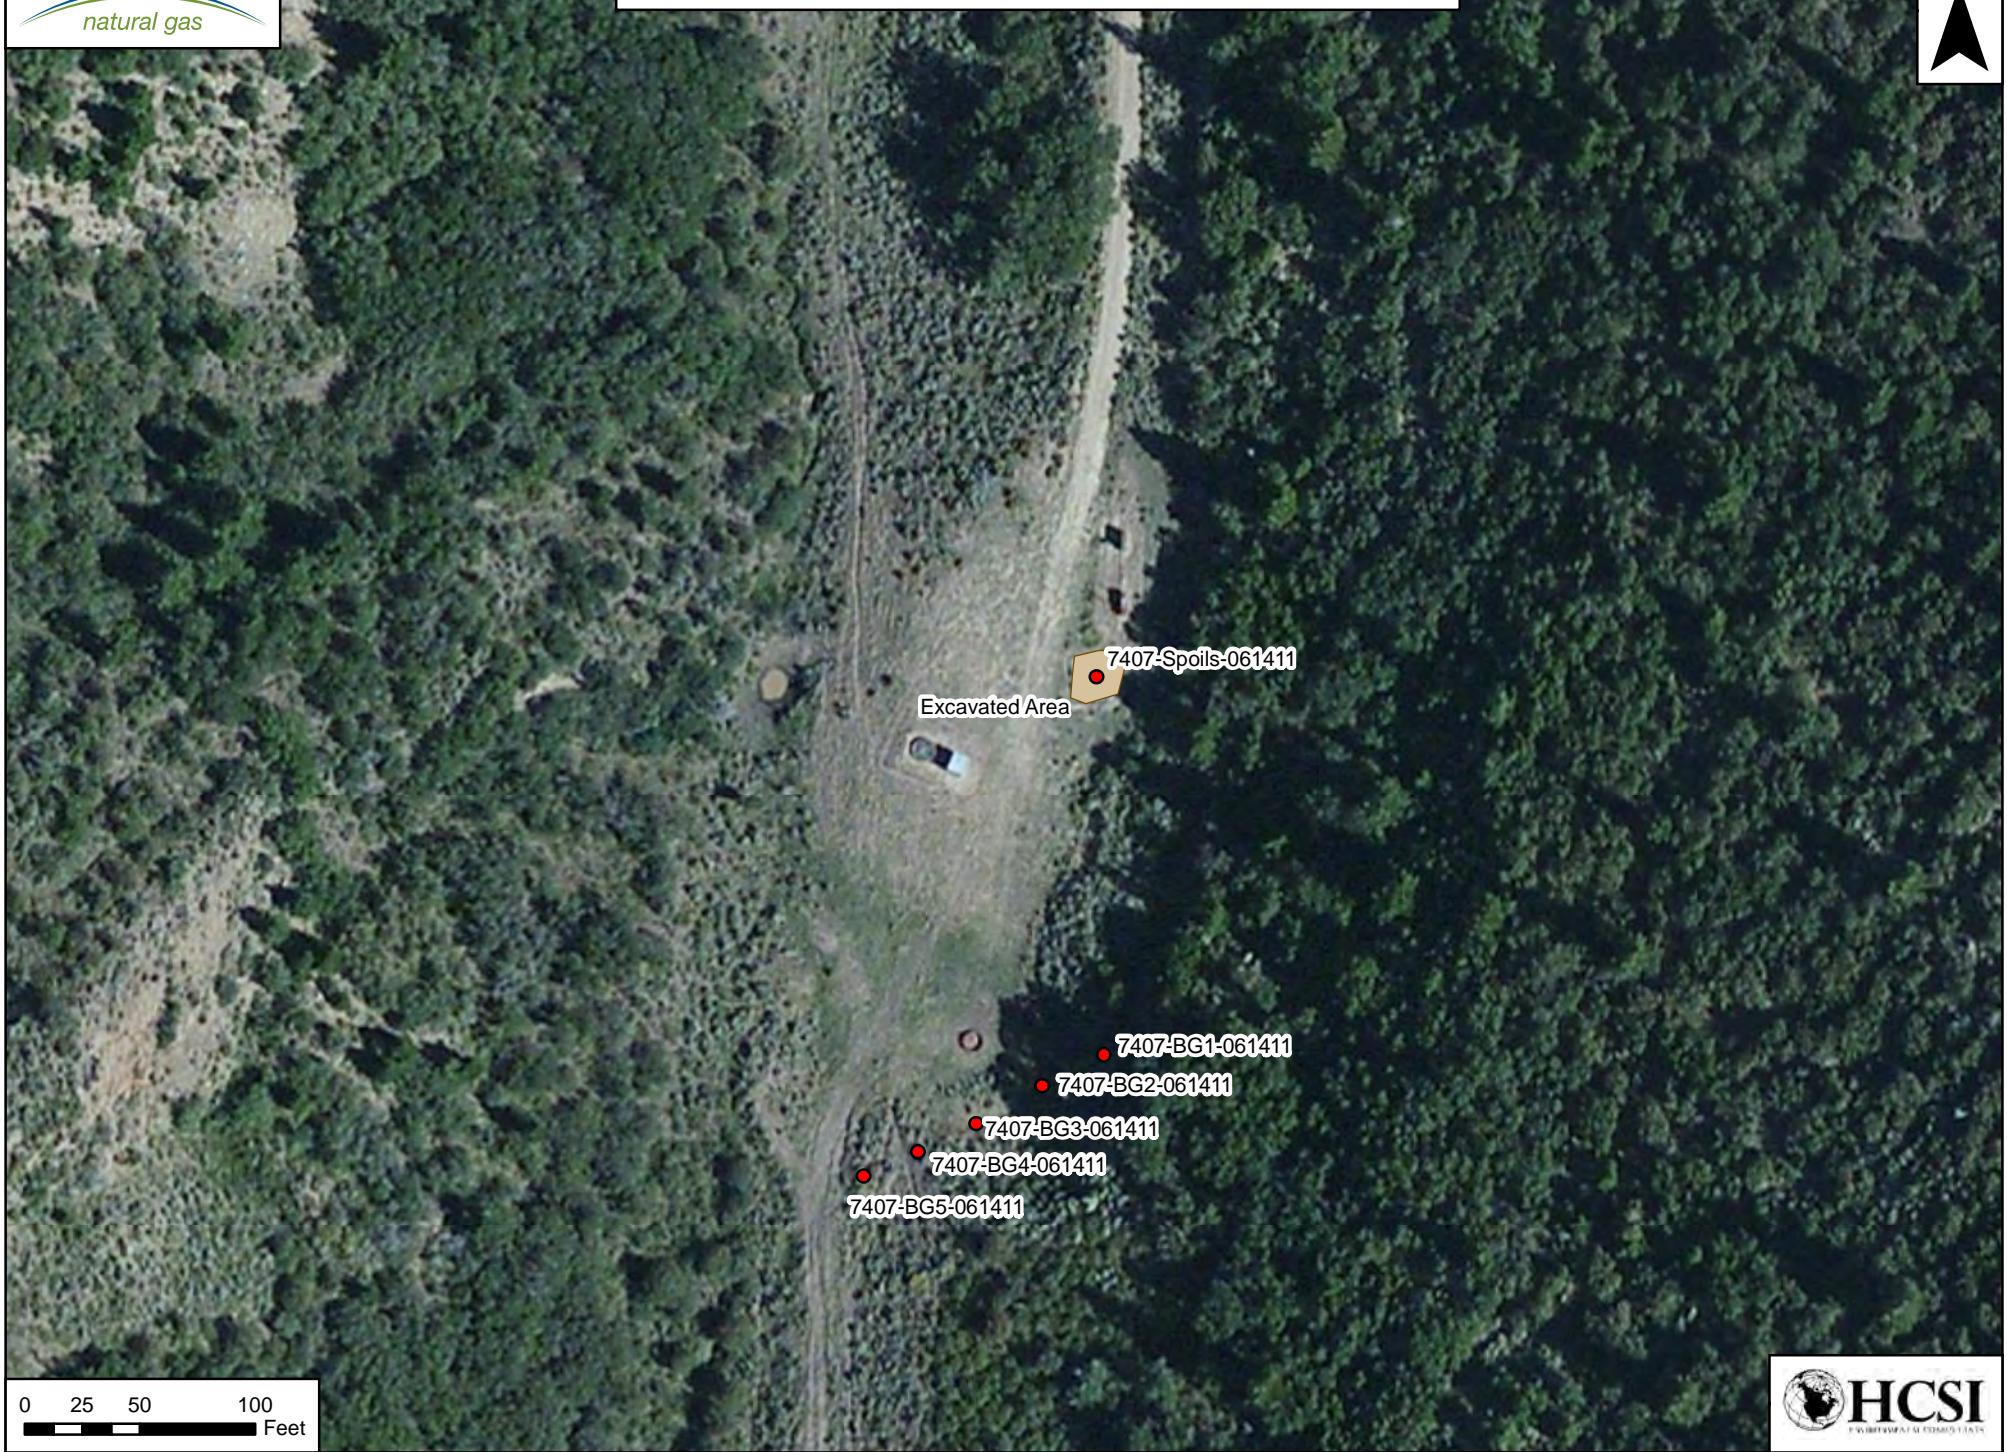

Based on the site investigation and analytical results, the pit associated with the Foundation Creek B 7407 is in compliance with the standards specified within COGCC Table 910-1. Encana respectfully requests that final closure be granted for the respective pit, COGCC remediation #5295.

## Analytical Review

Sample results indicate that the soil within the earthen pit footprint on Encana's Foundation Creek B 7407 well pad have exceedances of COGCC Table 910-1 allowable concentrations for arsenic (2.3 ppm). Though the arsenic concentration in the soil is above the allowable concentration identified in Table 910-1, the concentration is within the range of arsenic background values (2.3-3.0 ppm) in this area. Based on these results and footnote 1 to COGCC Table 910-1, Encana requests that the COGCC consider the higher range of background arsenic value(s) as the allowable concentration for this constituent. Please see Attachment A for the respective laboratory analytical results.

The data package includes a summary of the analytic results of the quality control samples required by the SW-846 or CWA methods. The quality control samples include a method blank, a laboratory control sample, and the matrix spike/matrix spike duplicate analysis. If a target parameter is outside the method limits, every sample that is effected is flagged with the appropriate qualifier in Appendix B of the analytic report.

Method Blank - an aliquot of reagent water carried through the entire analytic process. The method blank results indicate if any possible contamination exposure during the sample handling, digestion or extraction process, and analysis. Concentrations of target analytes above the reporting limit in the method blank are qualified with the "B" qualifier.

Laboratory Control Sample - is a sample of known concentration that is carried through the digestion/extraction and analysis process. The percent recovery, expressed as a percentage of the theoretical concentration, has statistical control limits indicating that the analytic process is "in control". If a target analyte is outside the control limits for the laboratory control sample or any other control sample, the parameter is flagged with a "J4" qualifier for all effected samples.

Matrix Spike and Matrix Spike Duplicate - is two aliquots of an environmental sample that is spiked with known concentrations of target analytes. The percent recovery of the target analytes also has statistical control limits. If any recoveries that are outside the method control limits, the sample that was selected for matrix spike/matrix spike duplicate analysis is flagged with either a "J5" or a "J6". The relative percent difference (%RPD) between the matrix spike and the matrix spike duplicate recoveries is all calculated. If the RPD is above the method limit, the effected samples are flagged with a "J3" qualifier.
