Jay:

We only did Open Hole logs on the KP 32-9 and the KP 422-9, the other two wells were only cased hole logs. I will see what I can do to get those to you in a pdf format as soon as I can.

1. When first opened the bradenheads produce some water, but then they begin to produce just gas. The KP 422-9 is producing a small amount of water with the gas.
2. The following build ups were observed. The KP 421-9 was not frac'd yesterday and was bled off at 5 pm

KP 421-9 Build up

9/16/2014 5:00	255

3. The KP 431-9 did not implement the 11.5 ppg LiteCRETE lead cement, it was a 13ppg lead, with 13.5 ppg tail. The other wells were a 11.5 ppg LiteCRETE lead cement, with a 13 ppg tail.

I attached a spreadsheet of the information you inquired about. Please let me know if you have any questions on that.

Thank you,

Jennifer Schrant

Jennifer:

Yes, I'm sure "your people" and we here at COGCC would benefit from open-hole logs on these wells.

A couple more questions/requests: when venting/opening-up the bradenheads -- is it just gas or are there any liquids associated with any of these wells?

Is WPX evaluating/taking note of THE RATE OF BUILD of the bradenhead pressures? That is, say, (for the 421-9) the BHP climbs to 160 ... and stays there?

What is it about the 431-9 that makes it "well-behaved" (pun not necessarily intended) and not the others?

I've attached a draft "table" of certain attributes or data from each well. If Jennifer could get back to me re: the TOCs and the Top Perf depth for each well, I'd appreciate it.

Jay,

Let me track down who normal submits those, and I will get them to you as soon as I can.

Thank you,

Jennifer

Jennifer:

I am conducting an investigation/research project of the wells (4) on this pad -- but I don't think WPX has submitted any logs (other than CBL and temp) to the COGCC well-files yet.

Hi Jay,

Just to follow up our phone call a few minutes ago. Wpx will return to frac'ing this well with the vent open later today, per instructions.

Thank you,

Jennifer Schrant
