Dear Mr. Chesson:

This correspondence summarizes water quality testing for samples obtained from groundwater monitoring wells at the four referenced NGL Water Solutions (NGL) facilities. Groundwater quality sampling activities were performed on September 16, and September 25, 2014.

Water quality samples obtained from the groundwater monitoring wells were analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX), total dissolved solids (TDS), and chlorides. These compounds are commonly associated with oil field exploration and production water, which is disposed of at the NGL water treatment and disposal facilities. The water quality monitoring program provides background data, which will facilitate early detection of an unknown release of production water related to facility processing operations. As previously reported, water quality samples obtained from the groundwater monitoring wells are analyzed for BTEX because these compounds are regulated by the Colorado Oil and Gas Conservation Commission (COGCC). Since the water quality samples from the above-referenced facilities have historically contained no detectable concentrations of total petroleum hydrocarbons (TPH) above laboratory method detection limits (MDLs), TPH has been omitted from the analytical program.

**C1-Kersey**

Water quality samples were obtained on September 25, 2014, from three groundwater monitoring wells (MW-East, MW-West, MW-North). Review of the analytical data in Attachment A documents that BTEX concentrations in the site monitoring wells were below laboratory MDLs during this sampling event. The TDS concentrations ranged from 910 milligrams per liter (mg/L) to 1170 mg/L, and chloride concentrations ranged from 151 mg/L to 210 mg/L, which remains consistent with historic data.

The groundwater flow direction was calculated by measuring the groundwater depth at each of the three monitoring points. Based on the depth to groundwater and surveyed elevations of the wells, the groundwater flow direction remains consistent with historical data, and is to the east towards well MW-East at a calculated hydraulic gradient of approximately 0.01 ft/ft. Figures illustrating site conditions, inferred groundwater contours, and analytical data are

included in Attachment A as Figures 1 through 3, respectively. A summary of historic groundwater quality and groundwater elevation data is included in Attachment A as Table 1.

#### **C4-Lyster-Greeley**

Water quality samples were obtained on September 16, 2014, from six groundwater monitoring wells (MW-1, MW-2, MW-6, MW-11, MW-12, MW-13). Review of the analytical data in Attachment B documents that BTEX concentrations in the site monitoring wells were below laboratory MDLs during this sampling event. The TDS concentrations ranged from 1,220 mg/L to 2,430 mg/L, and chloride concentrations ranged from 54.3 mg/L to 593 mg/L, which remain consistent with historical data.

The groundwater flow direction was calculated by measuring the groundwater depth at each of the six monitoring points. Based on the September 16, 2014, groundwater depth and surveyed elevations of the wells, the groundwater flow direction remains consistent with historic data and is to the south toward well MW-13 at a calculated hydraulic gradient of approximately 0.02 ft/ft. Figures illustrating site conditions, inferred groundwater contours, and analytical data are included in Attachment B as Figures 1 through 3, respectively. A summary of historic groundwater quality and groundwater elevation data is included in Attachment B as Table 2.

#### **C6-Platteville**

Water quality samples were obtained on September 16, 2014, from four groundwater monitoring wells (MW-3, MW-4, MW-5, MW-6). Review of the analytical data in Attachment C documents that BTEX concentrations in the site monitoring wells were below laboratory MDLs during this sampling event. The TDS concentrations ranged from 1,700 mg/L to 8,190 mg/L, and chloride concentrations ranged from 336 mg/L to 811 mg/L, which remains consistent with historic data.

The groundwater flow direction was calculated by measuring the groundwater depth at each of the four monitoring points. Based on the depth to groundwater and surveyed elevations of the wells, the groundwater flow direction remains consistent with historical data, and is to the east-southeast towards well MW-3 at a calculated hydraulic gradient of approximately 0.04 ft/ft. Figures illustrating site conditions, inferred groundwater contours, and analytical data are included in Attachment C as Figures 1 through 3, respectively. A summary of historic groundwater quality and groundwater elevation data is included in Attachment C as Table 3.

#### **C7-Briggsdale**

Water quality samples were obtained on September 16, 2014, from four groundwater monitoring wells (MW-1, MW-2, MW-4, MW-6). Review of the analytical data in Attachment D documents that BTEX concentrations in the site monitoring wells were below laboratory MDLs during this sampling event. The TDS concentrations ranged from 930 mg/L to 1,450 mg/L, and chloride concentrations ranged from 38.0 mg/L to 60.5 mg/L, which remains consistent with historic data.

The groundwater flow direction was calculated by measuring the groundwater depth at each of the site groundwater monitoring points. Based on the depth to groundwater and surveyed elevations of the wells, the groundwater flow direction remains consistent with historical data, and is to the west towards well MW-6 at a calculated hydraulic gradient of approximately 0.003 ft/ft. Figures illustrating site conditions, inferred groundwater contours, and analytical data are included in Attachment D as Figures 1 through 3, respectively. A summary of historic groundwater quality and groundwater elevation data is included in Attachment D as Table 4.

Based on the water quality analytical testing at the C1, C4, C6, and C7 facilities, it does not appear that a release has impacted the subsurface environment. The next semi-annual sampling event is scheduled for March 2014. Should you have any questions or require additional information, please call Mr. Craig Mulica at (800) 288-2657.

Sincerely,  
CGRS Inc.

Craig S. Mulica  
Associate Geologist

Notes:

Values in **bold face** exceed MCLs

TVPH = Total Volatile Petroleum Hydrocarbons

TEPH = Total Extractable Petroleum Hydrocarbons

TRPH = Total Recoverable Petroleum Hydrocarbons; Hexane extractable materials

MP = Monitoring Point: Monitors the secondary containment liners below the concrete unloading pad and the concrete sump.

MCL = COGCC Maximum Contaminant Level

MDL = Method Detection Limit

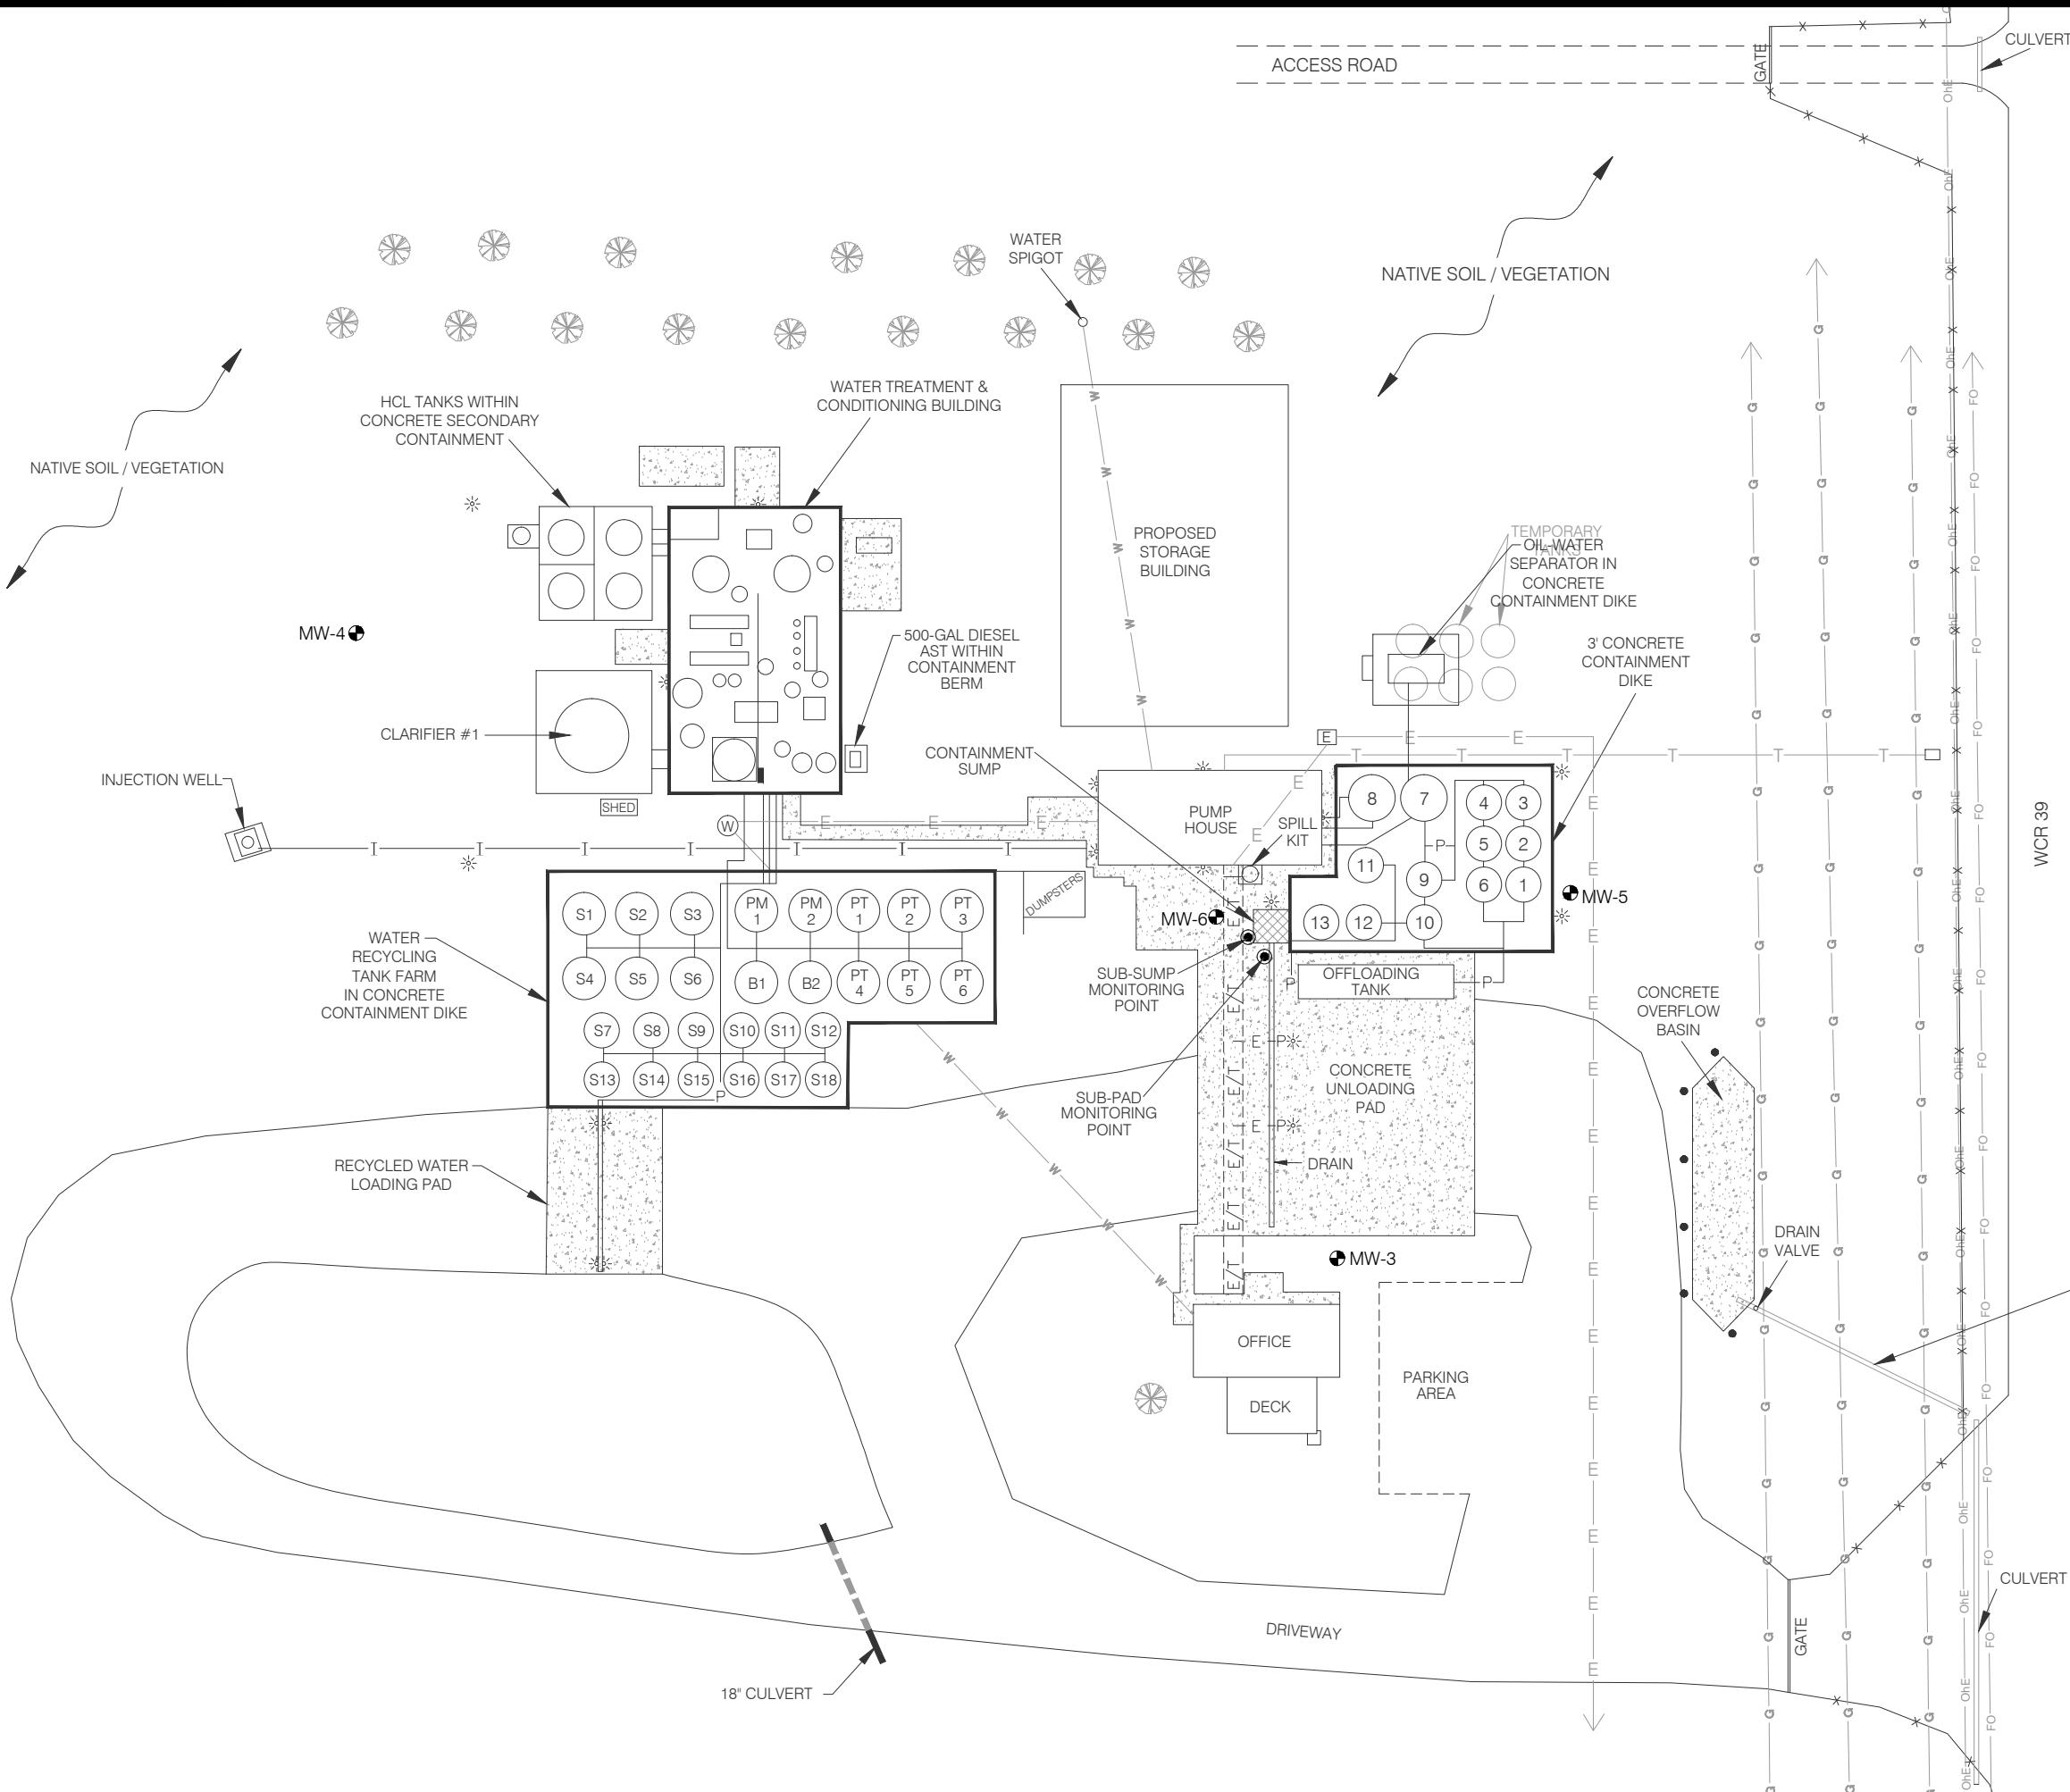

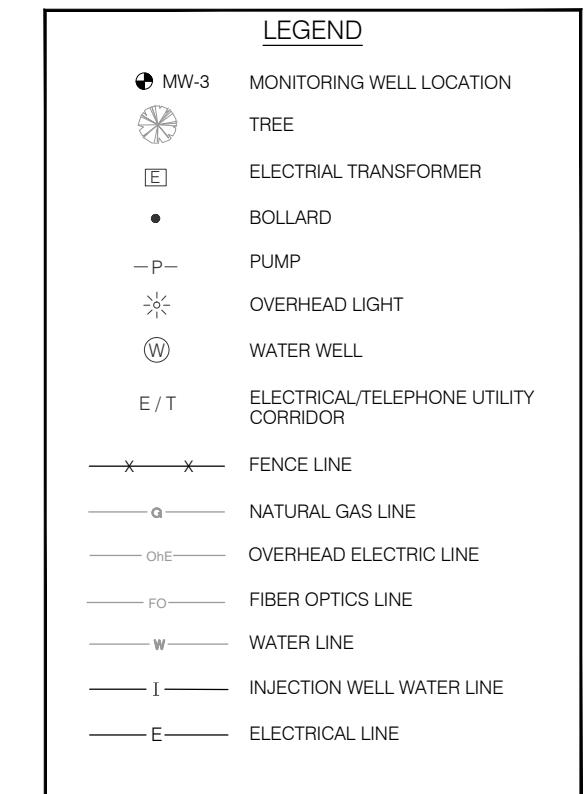

NS = Not Surveyed

NA = Not Analyzed

NM = Not measured

INA = Inaccessible

\* MW-4 damaged 1st Quarter 2014. Damage repaired and well resurveyed on 3/12/14. Groundwater measurement obtained after well resurvey.
