Subject: TR 22-34-597 update

To: "Spencer - DNR, Stan" <stan.spencer@state.co.us>

Stan,

After our onsite on Monday, the produced water that was trapped in between the liners was removed; four holes were cut in the upper liner and the fluids were removed utilizing a vac truck. All fluids were taken to the TR 41-35-597 multi-well pit (COGCC facility #422272).

The samples collected on Friday, March 27 tested non-detect for BTEX – see attached results and the sample location map.

During the onsite you asked for the liner thickness; the upper liner is 40 mil and, according to the Form 15, the second liner is 12 mil. I also checked the pit plats that were included with the pit permit Form 15 and the pit was constructed entirely in cut.

WPX is working with the surface owner on an agreement to add production tanks that will handle fluids generated at that location. All tanks will be placed inside lined SPCC containment ring. My next step is to submit an investigation/remediation workplan Form 27 for your approval. We will start the pit closure activities as soon as this agreement is finalized.

Please let me know if there is any additional information that you need in the meantime.

Thank you and have a great day,

**Karolina Blaney**
