Hey Rebecca,

Just wanted to follow up with you on the Long 22-B Pad. I spoke with the client and they informed us that the Surface Owner is only willing to grant an SUA to Edge if they located the pad in the part of the parcel that it is currently placed. He believes that is the best use of his land. In the spirit of cooperation with the Surface Owner Edge agreed to this location. I have attached a map showing the parcel ownership, and as you can see Long owns a good portion of the property in the area. In order to put the facilities on Link Ranch, Edge would have to pipe across the BUO property approximately 2000' feet which would present an economic burden. This would also put it in the vicinity (not buffer zone) of two BUO. In the interest of being a "good neighbor" the operator spoke with the BUO about their concerns. The operator has addressed the BUO concerns which included to visual mitigate the facilities with landscape screening, and to make sure that the BUO's water well would not be contaminated. Edge has also agreed to the following additional Noise mitigation:

Noise Mitigation: Baseline noise monitoring and testing will be conducted prior to commencement of construction and dirt work. Sound walls and/or hay bales will be implemented on the east side of the site to shield the building unit within the buffer zone. Both drilling and completion operations will be conducted within these sound barriers.

Given that all of the BUO concerns were addressed, the optional locations are not technically or economically feasible, Edge Energy believes the current location is the best location.

Please let me know what you guys think.

Thanks,

Jeff Annable

I have taken on the review of Edge Energy's Long 22-B Pad Form 2A (Doc #400776249) from Rebecca. I have completed my review and have some additional comments. We are currently still evaluating the additional siting rationale information you have provided.

- 1) In the Facilities section and on the Facility Layout Drawing, the Operator has indicated there will be six flares at this proposed oil and gas location. This is very unusual and seems excessive to have so many flares. Typically a single flare is sufficient to handle the emissions from even the 12 Oil Tanks listed for this location. Please provide a justification/explanation as to why the Operator needs six flares.
- 2) While reviewing the Cultural Distances, I noticed that the nearest Building is closer to this proposed oil and gas location than the nearest Building Unit. While the Location Drawing does show what is labelled as a Building to be closer than the nearest Building Unit, a review of aerial photographs appears to show this nearest Building to be a 18-wheeler tractor trailer parked at the Building Unit Owners residence. If this is indeed the case, then the nearest Building Unit is also the nearest Building and I would like to change the distance to the nearest Building for both the well and the production facility on the Form 2A.
- 3) A review of the water well permit for the nearest water well (Permit #245545) indicates it is a Domestic drinking water well that was screened from 895 to 980 feet below ground surface. A review of other nearby water wells indicates many were also similarly screened quite deeply with similarly deep static water levels listed. Based on that I don't think the estimated depth to groundwater of 440 feet is reflective of how shallow groundwater may be in the area of this proposed oil and gas location. Additionally there are several ponds nearby as shown on the Hydrology Map that also lead me to believe that groundwater is considerably shallower than 440 feet. Therefore, I would like to change the estimated depth to groundwater to 20 feet, and add a comment that explains why this depth was chosen. The Operator has already provided an adequate Berm Construction BMP and no pits are proposed for this location, so this change to the Water resources' section would not affect the construction and operation plans for this location that have already been provided. Please let me know if this is acceptable.
- 4) Due to the potential for shallow groundwater in the area of this oil and gas location as discussed in my Comment #3 above and the fact that the nearest downgradient surface water feature is less than 100 feet away, I would like to change the Sensitive Area designation to YES in the Water Resources section.
- 5) In you email above and also in the Operator Comments section of the Form 2A you have indicated how the Operator will address the concerns raised by the nearby Building Unit Owner. I would like to take these and copy them into the Operator BMP section of this Form 2A. Please let me know if that is acceptable.
- 6) The Rule 604.c.(2)S - Access Roads BMP indicates "*Dust control will also be utilized.*" Please provide additional site specific details as to these dust control measures.

Please respond to this correspondence by April 4, 2015. If you have any questions, please contact me.

Hey Doug,

I have answers to your questions below:

1)The Operator is going to reduce the number of flares to 1. I will be sending you an updated facility layout when I get it.

2)I agree the building that was depicted on the location drawing is an 18 wheeler, and agree to the change in measurements.

3)I agree to the changes to the water well depths.

4)I agree to the change in sensitive area.

5)I agree that it is acceptable for the BMP

6)Here is a revised BMP for the Dust Mitigation:

- Operator shall employ practices for control of fugitive dust caused by their operations. Such practices shall include but are not limited to the use of speed restrictions, regular road maintenance, restriction of construction activity during high- wind days, and silica dust controls when handling sand used in hydraulic fracturing operations. Additional management practices such as road surfacing, wind breaks and barriers, or automation of wells to reduce truck traffic may also be required if technologically feasible and economically reasonable to minimize fugitive dust emissions.

Please let me know if the justification for location is acceptable. Let me know if there is anything else that

you need.

Thanks,

Jeff Annable

Jeff,

Thanks for the prompt reply. Now that the Public Comment period has ended, please also send a letter certifying Edge Energy's compliance with COGCC Rule 306.e when you send the updated Facility Layout Drawing. Please indicate in the certification letter the meetings/consultations that were held with the Building Unit Owner and what the outcome was. I know you were mentioned in your email above to Rebecca, but we'd also like that same information included on the Rule 306.e Certification letter as well. Thanks.

Hey Doug,

Attached is the COGCC Rule 306.e certification as well as the updated facility layout. Please let me know if there is anything else that you need.

Thanks,

Jeff Annable

Jeff,

OGLA Supervisor John Noto did a review of this Form 2A and he had some additional information he'd like to have for this Form 2A before it is Final Approved.

1) You have indicated the drill cuttings will be disposed of via land spreading and that a COGCC land application site will be in place before use. The attached Waste Management Plan indicates the Dechant Farms Spread Field will be used. In the southeast part of Section 36, Township 3N, Rang 65W, I see three COGCC approved spread fields/beneficial reuse areas. Two are owned by Kerr-McGee and one (called Dechant-2) is owned by NGL Water Solution DJ. Are any of these three the spread fields Edge Energy will be using? If not, I would like to place a Condition of Approval on this Form 2A indicating this Waste Management Plan, along with our Land Application Plan Checklist, shall be submitted to the COGCC via a Form 4 Sundry for our review and approval prior to drilling operations.

2) You have indicated that the nearby Building Unit Owner's water well will be tested before and after drilling operations to assure no contamination occurred. We would like some additional specific information regarding this well and the testing protocol be added to the BMP. Specifically, what is the water well's DWR Permit #, a list of the analysis/analytes that the water sample will be tested for, how long after drilling operations will the water well be sampled, how many times will the water well be sampled, and concurrence that the analytical

results shall be kept on file with the Operator and made available to the COGCC upon our request.

3) Because the nearby Building Unit Owner is concerned about losing his view of the mountains, Edge Energy has agreed to landscaping to visually mitigate the facility. We would like some additional specific information regarding the visual mitigation of this location. Will there be berms built and landscaped to mitigate the view of the location? Has Edge Energy considered the use of low-profile tanks to provide less of an obstruction to the view of the mountains? If not, why not? What specifically has Edge Energy agreed to with the Building Unit Owner concerning the visual mitigation landscaping?

Hey Doug,

Please find answers to the questions you had below:

1) Edge Energy accepts the COA that will be placed on the Form 2A. Edge might use commercial disposal instead of land application and in that case a Form 4 sundry will be submitted with a statement attesting to this along with a updated Waste Management Plan.

2) Although the Building Unit Owner's (Judy Humphrey) water well is not located within the same governmental quarter section as described in Rule 318.A.f.(2).A for a potential well to be tested, Edge Energy will plan to test the Humphrey well in addition to the land owner's water well in the NW Section 22, T1N, R65W (Mr. Larry Long's well, assuming that it qualifies as an available water source and he grants permission). We will plan to follow the testing protocols specified in Rule 318.A.f with respect to the specified list of analytes for the Humphrey water well test. In addition, we will plan to test for the presence of methane. We have obtained verbal permission from Judy Humphrey to test her well prior to commencing drilling. We will plan to sample the well between 6 and 12 months following completion of the first well on the pad as described in Rule 318.A.f.(4).B.
