No: 970-263-3123
Fax: 970-263-3124

API Number (of associated well): 05-045-14979 OGCC Facility ID (of other associated facility): CP01B-16 B-16 59 NPR
Pit Location (QtrQtr, Sec, Twp, Rng, Meridian): NWNE, Sec 16, TWP 5S, RNG 96W, UTE 6th P.M.
Latitude: 39.62088 Longitude: -108.17224 County: Garfield

Pit Use: ☑ Production ☐ Drilling (Attach mud program) ☐ Special Purpose (Describe Use): _____
Pit Type: ☑ Lined ☐ Unlined Surface Discharge Permit: ☐ Yes ☑ No
Offsite disposal of pit contents: ☐ Injection ☐ Commercial Pit/Facility Name: B16 Pit/Facility No: B16
Attach Form 26 to identify Source Wells and Form 25 to provide Produced Water Analysis results.

Existing Site Conditions

Is the location in a "Sensitive Area?" ☐ Yes ☑ No **Attach data used for determination.**
Distance (in feet) to nearest surface water: 3824 ground water: > 20 water wells: > 2640 feet

LAND USE (or attach copy of Form 2A if previously submitted for associated well) Select one which best describes land use:

Crop Land: ☐ Irrigated ☐ Dry Land ☐ Improved Pasture ☐ Hay Meadow ☐ CRP
Non-Crop Land: ☑ Rangeland ☐ Timber ☐ Recreational ☐ Other (describe): _____
Subdivided: ☐ Industrial ☐ Commercial ☐ Residential

SOILS (or attach copy of Form 2A if previously submitted for associated well)

Soil map units form USNRCS survey: Sheet No: N/A (WSS) Soil Complex/Series No: 55, 56
Soils Series Name: Parachute-Irigul Complex, 5-30 percent slopes Horizon thickness (in inches): A: 10 ; B: 25 ; C: 29
Soils Series Name: Parachute-Irigul-Rhone Association, 25-50 percent slopes Horizon thickness (in inches): A: 13 ; B: 29 ; C: 35
Attach detailed site plan and topo map with pit location.

Pit Design and Construction

Size of pit (feet): Length: 240 Width: 100 Depth: 15
Calculated pit volume (bbls): 27,000 Daily inflow rate (bbls/day): Variable
Daily disposal rates (attach calculations): Evaporation: Minimal bbls/day Percolation: N/A bbls/day
Type of liner material: Reinforced Polyethylene Thickness: 36 mil top layer / 24 mil bottom layer
Attach description of proposed design and construction (include sketches and calculations).
Method of treatment of produced water prior to discharge into pit (separator, heater treater, other): Separator
Is pit fenced? ☐ Yes ☑ No Is pit netted? ☑ Yes ☐ No

I hereby certify that the statements made in this form are, to the best of my knowledge, true, correct, and complete.

Re: Results of Compression Loading Testing (TRI Log 2308-47-03)

Dear Mr. Heap,

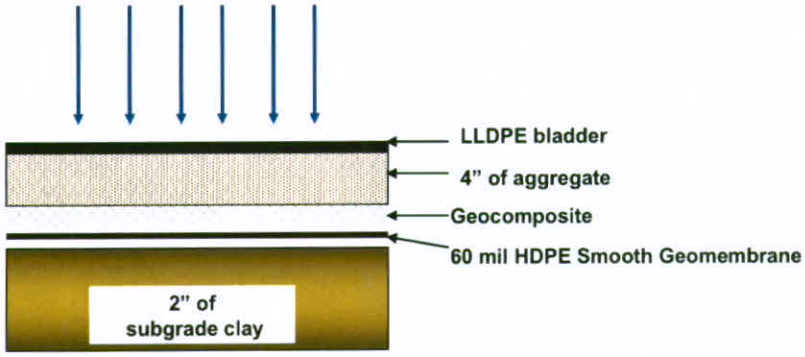
TRI/Environmental, Inc. (TRI) is pleased to present this final report for the requested compression testing in support of the Roan Plateau shale project. The testing was performed to determine the out-of-plane deformation resistance of a 60 mil HDPE smooth geomembrane and a 36 mil RPE geomembrane to compressive loading within a liner system. All sample materials and testing activities were managed under TRI log number E2308-47-03.

Technical Approach

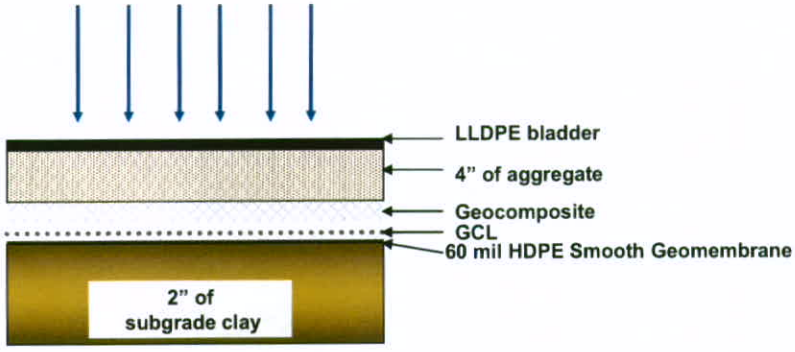
The compression testing was performed in general accordance with ASTM D 5514, *Test Method for Large Scale Hydrostatic Puncture Testing of Geosynthetics*. The test vessel measured 30" in diameter facilitating a 24" diameter test area. The test vessel is composed of a top and bottom half with an intermediate center section measuring 4" in height. The bottom of the test vessel was filled with a compacted clay liner substrate, which the geomembranes were placed over. Four different liner configurations were evaluated. Test configurations are depicted in the test configuration section. Each liner configuration was separated from the loading system via a 40 mil LLDPE geomembrane bladder.

After securing the top test chamber, air was introduced above the bladder to provide normal compressive stress through the bladder and onto the liner system. A normal compressive stress was applied at 1 psi per minute until a static load of 20.8 psi was achieved. This load was allowed to remain static for 1 hour.

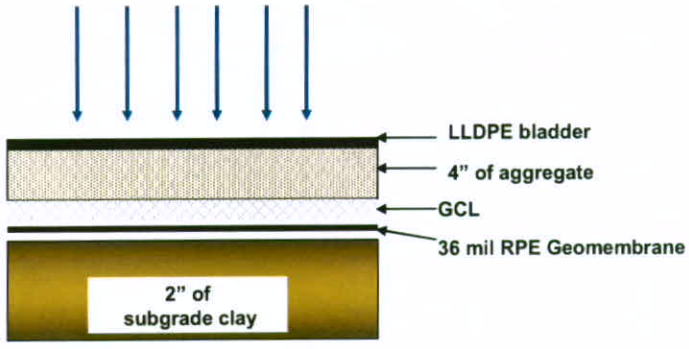
Test Configurations:



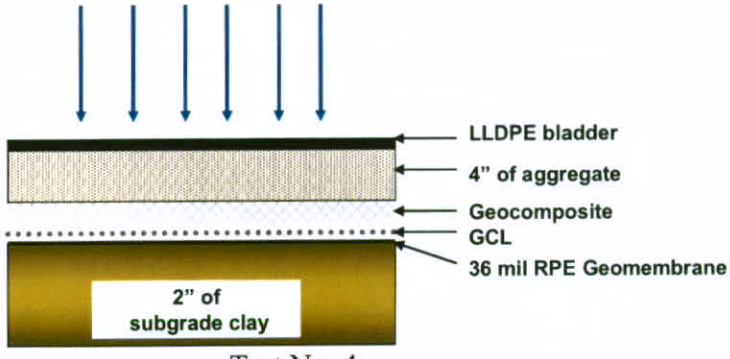
Test No. 1



Test No. 2



Test No. 3



Test No. 4

Post Test Inspection: After dismantling, the 60 mil smooth and 36 mil RPE geomembranes were inspected for out-of-plane deformations, punctures, and abrasions. Pictures showing equipment, system layers and post test exposure are also included. No visible punctures of the geomembrane were found.

Test No.	Observations
1	**No measurable deformations, no punctures or notable marks**
2	**No measurable deformations, no punctures or notable marks**
3	**Three barely visible deformations noted, no punctures or notable marks**
4	**No measurable deformations, no punctures or notable marks**

Conclusion

TRI trusts that this report sufficiently documents the testing described herein. TRI is pleased to be of service to Colorado Lining. Please contact me if you have any questions or require any additional information.

Sincerely,

John M. Allen

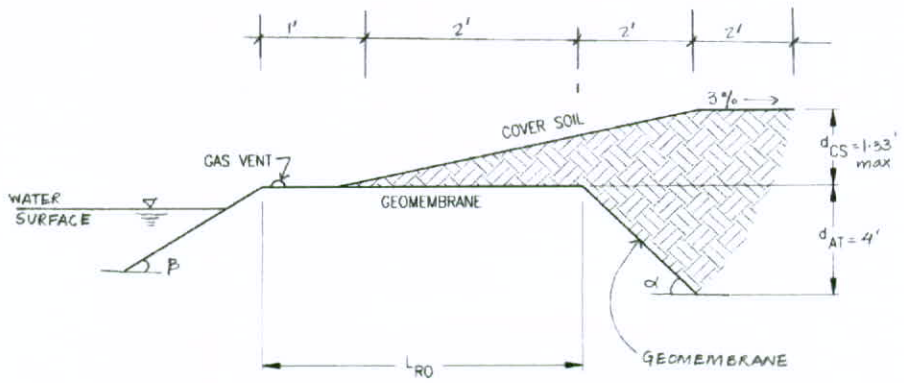
Runout Length and Anchor Trench Design using GEOMEMBRANE

Designed: N. Das
10/6/2008



ANCHOR TRENCH DESIGN FOR B-16 : NOT TO SCALE

36 mil RPE

Runout distance	L_{RO}	3	ft
Depth of the anchor trench	d_{AT}	4.0	ft
Unit weight of cover soil (Shale)	γ_S	135	pcf
Thickness of soil cover	d_{cs}	0.60	ft
Friction Angle between Geomembrane and underlying soil	δ_c	25	degrees
Friction Angle between Geomembrane and the backfill	δ_F	N/A	degrees
Bottom Angle of the V Shaped Anchor Trench	α	45	degrees
Side Slope Angle	β	26.6	degrees
Ultimate Tensile Strength of 36 mil RPE	T_{ult}	840	plf
	$\sin \beta$	0.448	
	$\cos \beta$	0.894	
	$\tan \delta_c$	0.466	
	$\cos \alpha$	0.707	
Resistant Capacity of 36 mil RPE	T_{AT}	841	plf

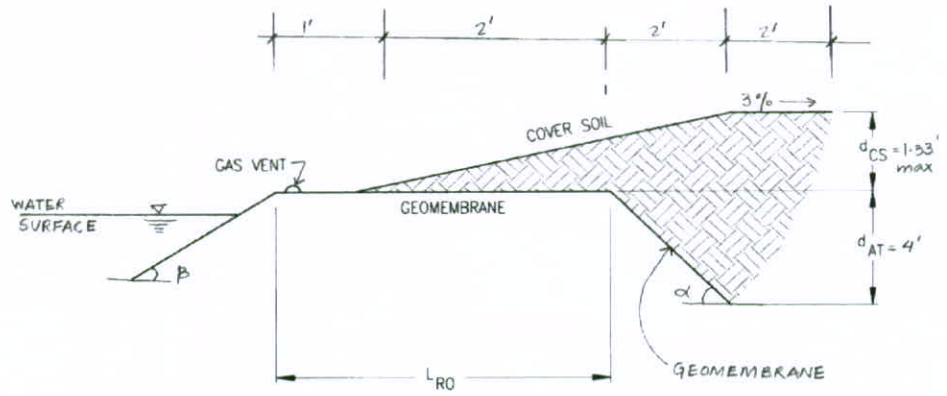
Note:

If $T_{ult} < T_{AT}$, The Geomembrane will fail if sufficient tensile stresses are mobilized.

If $T_{ult} > T_{AT}$, The Geomembrane will pull out if sufficient tensile stresses are mobilized.

If $T_{ult} = T_{AT}$, indicates a balanced design.

Runout Length and Anchor Trench Design using GEOMEMBRANE	Designed: N. Das 10/6/2008



ANCHOR TRENCH DESIGN FOR B-16 : NOT TO SCALE

24 mil RPE

Runout distance	L_{RO}	3	ft
Depth of the anchor trench	d_{AT}	4.0	ft
Unit weight of cover soil	γ_S	135	pcf
Thickness of soil cover	d_{cs}	0.60	ft
Friction Angle between Geomembrane and underlying soil	δ_c	25	degrees
Friction Angle between Geomembrane and the backfill	δ_F	N/A	degrees
Bottom Angle of the V Shaped Anchor Trench	α	45	degrees
Side Slope Angle	β	26.5	degrees
Ultimate Tensile Strength of 24 mil RPE	T_{ult}	750	plf
	$\sin \beta$	0.446	
	$\cos \beta$	0.895	
	$\tan \delta_c$	0.466	
	$\cos \alpha$	0.707	
Resistant Capacity of 24 mil RPE	T_{AT}	839	plf

Note:

If $T_{ult} < T_{AT}$, The Geomembrane will fail if sufficient tensile stresses are mobilized.

If $T_{ult} > T_{AT}$, The Geomembrane will pull out if sufficient tensile stresses are mobilized.

If $T_{ult} = T_{AT}$, a balanced design results.

55—Parachute-Irigul complex, 5 to 30 percent slopes

Map Unit Setting

- *Elevation:* 7,600 to 8,800 feet
- *Mean annual precipitation:* 18 to 22 inches
- *Mean annual air temperature:* 36 to 40 degrees F
- *Frost-free period:* 65 to 90 days

Map Unit Composition

- *Parachute and similar soils:* 60 percent
- *Irigul and similar soils:* 30 percent

Description of Parachute

Setting

- *Landform:* Mountains
- *Landform position (two-dimensional):* Shoulder, summit
- *Landform position (three-dimensional):* Mountaintop
- *Down-slope shape:* Linear
- *Across-slope shape:* Convex
- *Parent material:* Residuum weathered from shale and siltstone and/or residuum weathered from sandstone and shale

Properties and qualities

- *Slope:* 5 to 30 percent
- *Depth to restrictive feature:* 20 to 40 inches to paralithic bedrock
- *Drainage class:* Well drained
- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Low (about 4.0 inches)

Interpretive groups

- *Land capability (nonirrigated):* 6e
- *Ecological site:* Mountain Loam (R048AY228CO)

Typical profile

- *0 to 10 inches:* Loam
- *10 to 25 inches:* Very channery loam, extremely channery loam
- *25 to 29 inches:* Unweathered bedrock

Description of Irigul

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Backslope, shoulder, toeslope, summit, footslope
- *Landform position (three-dimensional):* Crest
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex
- *Parent material:* Residuum weathered from sandstone and shale

Properties and qualities

- *Slope:* 5 to 30 percent
- *Depth to restrictive feature:* 5 to 20 inches to lithic bedrock
- *Drainage class:* Well drained
- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Very low (about 1.3 inches)

Interpretive groups

- *Land capability (nonirrigated):* 7e
- *Ecological site:* Loamy Slopes (R048AY303CO)

Typical profile

- *0 to 6 inches:* Channery loam
- *6 to 13 inches:* Very channery loam
- *13 to 17 inches:* Unweathered bedrock

56—Parachute-Irigul-Rhone association, 25 to 50 percent slopes

Map Unit Setting

- *Elevation:* 7,600 to 8,800 feet
- *Mean annual precipitation:* 18 to 22 inches
- *Mean annual air temperature:* 36 to 40 degrees F
- *Frost-free period:* 65 to 80 days

Map Unit Composition

- *Parachute and similar soils:* 35 percent
- *Irigul and similar soils:* 30 percent
- *Rhone and similar soils:* 20 percent

Description of Parachute

Setting

- *Landform:* Mountains
- *Landform position (two-dimensional):* Summit, shoulder
- *Landform position (three-dimensional):* Mountaintop
- *Down-slope shape:* Linear
- *Across-slope shape:* Convex
- *Parent material:* Colluvium derived from sandstone and shale and/or residuum weathered from siltstone

Properties and qualities

- *Slope:* 25 to 50 percent
- *Depth to restrictive feature:* 20 to 40 inches to paralithic bedrock
- *Drainage class:* Well drained
- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Low (about 4.0 inches)

Interpretive groups

- *Land capability (nonirrigated):* 7e
- *Ecological site:* Brushy Loam (R048AY238CO)

Typical profile

- *0 to 10 inches:* Loam
- *10 to 25 inches:* Very channery loam, extremely channery loam
- *25 to 29 inches:* Unweathered bedrock

Description of Irigul

Setting

- *Landform:* Hills
- *Landform position (two-dimensional):* Toeslope, summit, footslope, backslope, shoulder
- *Landform position (three-dimensional):* Crest
- *Down-slope shape:* Convex
- *Across-slope shape:* Convex
- *Parent material:* Residuum weathered from sandstone and shale

Properties and qualities

- *Slope:* 25 to 50 percent
- *Depth to restrictive feature:* 5 to 20 inches to lithic bedrock
- *Drainage class:* Well drained
- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Very low (about 1.3 inches)

Interpretive groups

- *Land capability (nonirrigated):* 7e
- *Ecological site:* Loamy Slopes (R048AY303CO)

Typical profile

- *0 to 6 inches:* Channery loam
- *6 to 13 inches:* Very channery loam
- *13 to 17 inches:* Unweathered bedrock

Description of Rhone

Setting

- *Landform:* Hills, mountains
- *Landform position (two-dimensional):* Backslope, shoulder, summit, footslope
- *Landform position (three-dimensional):* Mountainflank, side slope
- *Down-slope shape:* Concave
- *Across-slope shape:* Concave
- *Parent material:* Colluvium derived from sandstone and shale and/or residuum weathered from sandstone and shale

Properties and qualities

- *Slope:* 25 to 50 percent
- *Depth to restrictive feature:* 40 to 60 inches to paralithic bedrock
- *Drainage class:* Well drained

- *Capacity of the most limiting layer to transmit water (Ksat):* Moderately low to moderately high (0.06 to 0.20 in/hr)
- *Depth to water table:* More than 80 inches
- *Frequency of flooding:* None
- *Frequency of ponding:* None
- *Available water capacity:* Moderate (about 7.5 inches)

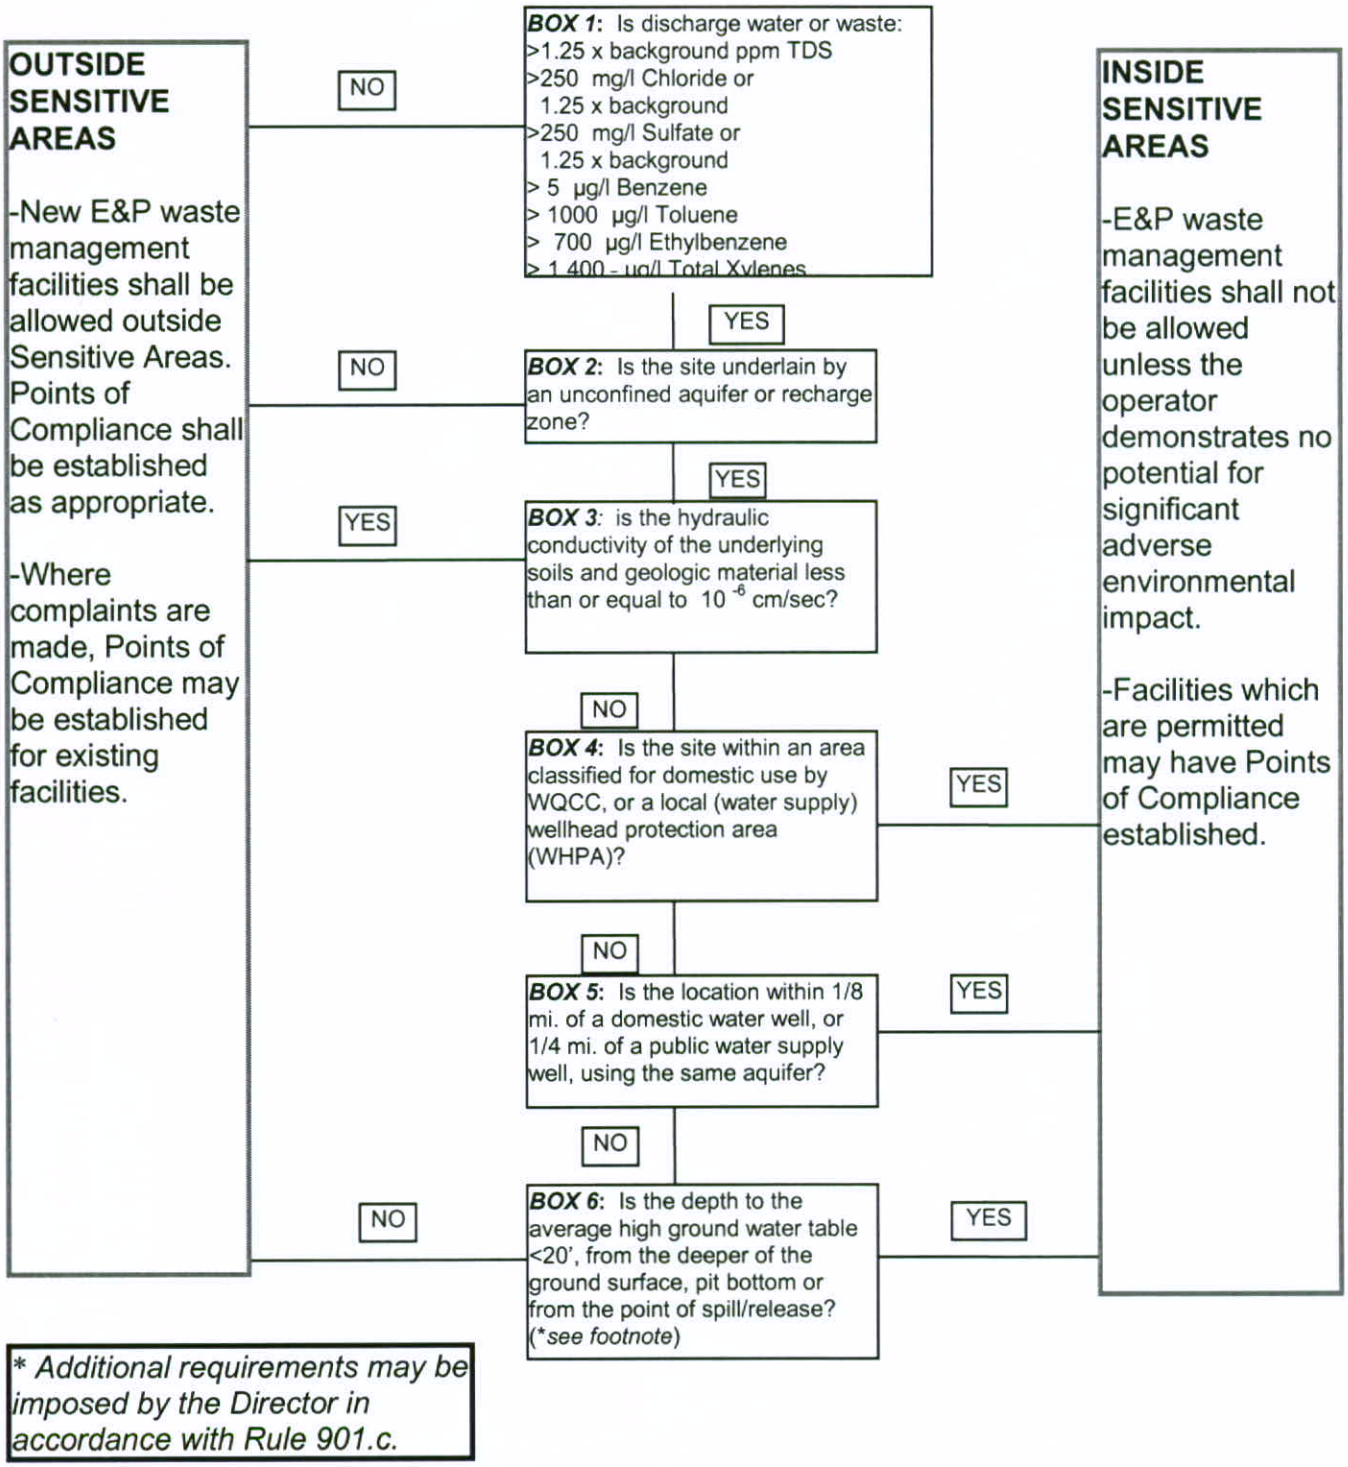
Interpretive groups

- *Land capability (nonirrigated):* 7e
- *Ecological site:* Brushy Loam (R048AY238CO)

Typical profile

- *0 to 10 inches:* Loam
- *10 to 39 inches:* Channery loam
- *39 to 55 inches:* Very channery loam
- *55 to 59 inches:* Unweathered bedrock

Figure 901-1
SENSITIVE AREA DETERMINATION
Decision Tree



** Additional requirements may be imposed by the Director in accordance with Rule 901.c.*

APPENDIX PART II

SENSITIVE AREA INDENTIFICIATON GUIDANCE DOCUMENT

A. PURPOSE OF THE GUIDANCE DOCUMENT

The Sensitive Area Identification Guidance Document specifically applies to the determination of areas in which unlined earthen produced water pits installed for use by oil and gas operations may be restricted.

This guidance document was developed to provide direction to both operators and COGCC staff for determination of Sensitive Areas (SAs). This document supports the implementation of the 900 Series of COGCC Rules, which establish the permitting, construction, operating and closure requirements for all pits used in oil and gas operations.

This document was prepared with the assistance of our stakeholders, including the oil and gas industry and the Water Quality Control Division (WQCD). This document may be revised periodically, when additional facts and data indicate a change is needed. Each document revision will be presented to the COGCC Commissioners for adoption by order of the Commission after a public hearing.

B. METHOD OF IDENTIFICATION OF SENSITIVE AREAS

Identification criteria were chosen to ensure the protection of ground water in accordance with WQCC standards and classifications, relative to oil and gas operations. After much discussion, the initial list of criteria was narrowed to the factors which would result in the most accurate identification of SAs using reasonable sources of available information. These identification criteria include:

- quality of the produced water,
- presence of unconfined aquifers or recharge areas,
- hydraulic conductivity of soils and geologic material under pit,
- presence of a WQCC classified area or wellhead protection area,
- proximity to public or domestic water supply wells,
- depth and quality of ground water.

The decision tree method was employed for easy use by operators. The operator may determine whether a location is in a SA by answering the questions posed in the following decision tree. The operator will make a SA determination for each existing and new pit only once.

Various sources of information available for answering the questions are noted. If vital information or data are incomplete or missing, then it is the responsibility of the operator to provide the minimum information necessary. The operator may also provide field observations and data to fulfill determination requirements.

When a discrepancy or question regarding the sensitivity of an area arises, the COGCC staff should be consulted. The COGCC will make the final determination in any dispute over whether a location is in a SA.

C. THE DECISION TREE

The decision tree consists of a series of technical questions. Explanations of these questions follow:

Box 1: Does the produced water to be placed in pit meet WQCC standards for ground water for the following contaminants of concern?

< Total Dissolved Solids (TDS) at 1.25 x background
< 250 ppm Chloride or background, whichever is higher
< 250 ppm Sulfate or background, whichever is higher
< 5 ppb Benzene
< 1,000 ppb Toluene
< 680 ppb Ethylbenzene
< 10,000 ppb Xylenes

YES - Produced water quality is below action levels stated in WQCC ground water standards. The risk to ground water resources posed by placing this produced water into unlined pits is considered insignificant and will be allowed.

NO - Contaminants of concern are present in the produced water at concentrations above the ground water standards. The risk to ground water posed by placing this produced water into unlined pits may be significant. Continue with decision tree.

The levels noted above are derived from ground water standards established by the WQCC. Their use in Box 1 does not imply that produced water must meet these standards in all pit situations.

Data References: These data must be obtained from testing the produced water. For a proposed new pit, the concentrations may be estimated from produced water quality data from wells in a common producing area.

Box 2: Is the pit location underlain by an unconfined aquifer or recharge zone?

An unconfined aquifer may occur in bedrock or in unconsolidated deposits, primarily alluvium adjacent to the Platte or other rivers. This does not include a small isolated occurrence of ground water that is not in communication with other hydrologic units. Wetlands should also be considered as they are likely to be in communication with shallow ground water and surface water.

YES - The location is in a SA and produced water placed into an unlined earthen pit here has a high potential to adversely impact ground water. Continue with decision tree.

NO - The location is not in a SA, and produced water placed in an unlined earthen pit here would have a low potential to adversely impact ground water.

References: USGS Hydrologic and Geologic Maps, NRCS (SCS) maps, wetland designation maps and field designations by the Army Corps of Engineers, and State Engineer's records.

Box 3: Is the hydraulic conductivity of the underlying soils and geologic material between the pit bottom and the aquifer less than or equal to 10^{-6} cm/sec?

Where the permeability of the soil and geologic material is high, produced water percolating from the pit may move easily to lower zones. As an example, sandy soil would allow a high rate of percolation of produced water from an unlined pit.

YES - The potential for adversely impacting ground water is high. Continue with decision tree.

NO - The ground water should be protected by the existing soils acting as a barrier to percolation of produced water. The location is not in a SA.

References: NRCS (SCS) Soil Surveys (for soil characterizations to about 5' below surface).

Box 4A: Is the **existing** pit location within a specified area for which the WQCC has classified the ground water or within a wellhead protection area (WHPA) as of 7/1/95? OR

Box 4B: Is the **new** pit location within a specified area for which the WQCC has classified the ground water or within a wellhead protection area (WHPA) at the date of construction?

The ground water in specified areas must be protected because it is used as a drinking water or other public water supply. Local entities may also designate areas for protection for similar reasons.

YES - The potential for adversely impacting ground water used as a public water supply exists. This location is in a SA.

NO - An unlined pit is not likely to adversely impact a public water supply. Continue with decision tree.

References: See WQCC regulations, which includes maps of specified areas. WHPA information may be obtained from local governments.

Box 5: Is the pit location within:
660' (1/8 mi.) of a domestic water well, OR
1320' (1/4 mi.) of a public water supply well, and completed in the same aquifer that may be adversely impacted from an unlined earthen pit?

YES - The potential for adversely impacting ground water used by the public exists. The location is in a SA.

NO - An unlined pit has a low potential for adversely impacting ground water used by the public. Continue with decision tree.

References: Colorado State Engineer's database, landowners, and local water well drillers.

Box 6: Is the depth from the pit bottom to the ground water table less than 20', estimated to be the average high ground water level, including influence of irrigation? The average high should be the level of the ground water table during spring runoff or crop irrigation (whichever is higher).

YES - The potential for adversely impacting the ground water is high. This location is in a SA.

NO - An unlined pit has a low potential for adversely impacting ground water, so the location is not in a SA.

References: USGS Hydrologic and Geologic maps and Water Supply studies, landowners, local water well drillers, NCRS (SCS), and agriculture organizations such as the CSU Extension Service.

D. DECISION TREE RESULTS

1. IF THE LOCATION **IS NOT** IN A SENSITIVE AREA:

Unlined earthen pits (and buried concrete sumps or other non-leakproof vessels) are an acceptable method for handling produced water. A pit permit must be obtained in accordance with COGCC Rule 903. Points of Compliance may be included as permit conditions.

2. IF THE LOCATION **IS** IN A SENSITIVE AREA:

Unlined earthen pits ARE NOT an acceptable method for disposing of produced water. Equipment such as aboveground tanks, below-grade leakproof tanks or vessels (such as FRP or lined/coated steel), or adequate lining in an earthen pit may be used. Other methods of produced water disposal may be used such as evaporation, injection into a permitted UIC Class II well or surface discharge in accordance with WQCD Colorado Discharge Permit System (CDPS).

An operator may provide data that demonstrates that the proposed unlined pit will not impact ground water. An operator may also provide information that demonstrates the existing ground water is not currently nor likely to be used by the public. The COGCC will evaluate the proposal and supporting data, and may allow an unlined pit, where the placement of produced water into an unlined pit will not adversely impact ground water resources.

The operator may choose to perform analyses to determine the quality of the existing ground water that may be impacted. Should the produced water quality analyses show it to be of better quality than the existing ground water, the unlined pit may be authorized. This concept is further explained on attached Produced Water Quality Decision Tree.

1.0 GENERAL

A. Related specifications: 02530 GEOSYNTHETICS INSTALLATION.

B. These technical specifications establish the quality of materials and workmanship and define how quality is measured for earthwork, hard material subgrade, and leak detection wells. They apply to lined containment pond areas. It also establishes the quality of materials and workmanship for furnishing, delivering, installing and constructing hard material subgrade and standard leak detection wells for double-lined systems.

C. The word "Owner," as used here shall mean ConocoPhillips.

2.0 ABBREVIATIONS

A. The abbreviation below shall mean:

AASHTO..... American Association of State Highway and Transportation Officials

ASTM..... American Society for Testing Materials

3.0 CODES AND STANDARDS

A. Unless otherwise specified or shown on drawings, the following codes and standards shall apply to the extent indicated herein:

ASTM D422..... Standard Method of Test for Particle-Size/Analysis of Soils

ASTM D2487.... Standard Test Methods for Classification of Soils for Engineering Purposes

ASTM D2488.... Standard Practice for Description and Identification of Soils (Visual-Manual Procedure)

ASTM D3740.... Evaluation of Agencies engaged in Testing and/or Inspection of Soil and Rock as used in Engineering Designing Construction

4.0 MATERIALS

A. Hard materials will be encountered in 100 percent of the excavation from the existing surface.

B. Material for subgrade will consist of the naturally occurring shale rock, shaped to the lines and grades on the Design Drawings. The naturally occurring shale rock

shall be broken into pieces with excavation equipment. The side slopes and bottom of the excavation shall be shaped with aggregate less than 2 inches in diameter in a manner that is smooth and does not allow for protrusion of rocks from the planar surface of the side slopes and the bottom of the pit.

C. Drill cuttings mixed with fly ash and wood chips or drill cuttings alone may be used to provide a smooth finish to the subgrade for placement of the geosynthetic liner materials including geocomposites. Such cuttings must have passed the testing required by COGCC in Table 910-1.

D. Materials will consist of the geocomposites and geomembranes used in the pond liner system. The leak detection well shall consist of 8-in diameter HDPE pipe perforated at the bottom end as shown on the design drawings. The 8-in HDPE shall be sealed from the primary liner with a pipe boot. An 8-in cap will be provided above grade as shown on the design drawings. Refer to 02530 GEOSYNTHETICS INSTALLATION for more information on geocomposites and geomembranes.

E. A minimum 4-ft x 4-ft x 16-in deep sump pit filled with gravel and wrapped with 8-oz non-woven geotextile fabric shall be placed at the low point of the pond and at the bottom end of the leak detection well. Refer to 02530 GEOSYNTHETICS INSTALLATION for more information on geotextile.

F. Class 2 Backfill is defined as all soils and rock excavated at the site with a diameter of less than 2 inch maximum dimension. Suitable equipment or approved procedures shall be provided to ensure the maximum dimension is not exceeded.

5.0 QUALITY ASSURANCE

A. Quality assurance during preparation of hard material subgrade shall be performed by an agent of the sealing engineer. Inspections during filed construction shall be visual and the subgrade shall be approved by the certifying engineer prior to placement of the liner system.

B. The owner shall engage a third party independent Engineering firm for quality control.

C. Inspections during filed construction shall be visual and the subgrade shall be approved by the certifying engineer prior to placement of the leak detection well and related liners. The leak detection well shall be approved by the certifying engineer prior to backfill of the well.

6.0 PROJECT SITE CONDITIONS

A. Data on indicated subsurface conditions are made available for the convenience of the earthwork contractor and are not intended as representations or warranties of continuity of such conditions.

B. Protect existing benchmarks and monuments and other reference points; if disturbed or destroyed, replace as directed by Owner.

C. Erect and maintain such safeguards as required by construction operations, codes or existing conditions, for the safety of persons or property and to protect the same from damage, injury or loss.

D. Provide for diversion of surface drainage during the period of earthwork, keeping excavations free of water during entire process of work, regardless of cause, source or nature of the water.

7.0 SURVEY

A. The Owner will establish the control point(s) to be utilized by the Contractor. The Contractor shall be responsible for all construction surveying to control the work.

B. Cross-sections of the original surface and the as-built condition will be taken as directed.

C. Prior to installation of any geosynthetic liners, Contractor shall verify with grading level that the pit side slopes are 2:1 maximum, the bottom of the pit slopes as designed for the leak detection system, and the pit depth and general layout is per the design drawings.

D. All survey work will be subject to checking by the Owner or Owner's representative.

8.0 CLEARING AND GRUBBING

A. Existing pit will be drained and the existing liner system removed prior to construction.

B. Existing fencing will be removed prior to the start of work to allow for proper re-shaping of the existing pit.

C. Fluids, solids, and existing liners removed from the existing pit shall be disposed of at the waste locations identified and approved by Owner.

D. Clearing and grubbing shall be performed as required.

E. Clearing will consist of the removal and disposal of all brush, grass, rubbish, and other obstructions resting on the surface of the original ground. Unless otherwise indicated, clearing shall be performed within the limits of and ten feet outside of the pits.

9.0 DUST PALLIATIVE

A. Apply water or chemical for the control of airborne dust originating as a result of earthwork operations in accordance with applicable ordinances and regulations. Chemicals if utilized are to be approved in advance of use by field.

10.0 EXCAVATION

A. Classification of all excavated materials shall be included in the following:

1. Common and Rippable Excavation shall consist of all materials that can be excavated without blasting. Rippable excavation shall consist of all materials that can be effectively loosened or broken down by ripping in a single pass with a late model tractor-mounted hydraulic ripper equipped with one digging point of standard manufacturer's design adequately sized for use with and propelled by a crawler-type tractor rated equal to or better than a D-9 Caterpillar flywheel horsepower, operating in low gear. Additionally, all boulders or detached pieces of solid rock less than 2 cubic yards in volume will be classified as Common and Rippable Excavation.

2. Rock Excavation - For the purpose of classification of excavation, rock is defined as sound and solid masses, layers, or ledges of mineral matter in place and of such hardness and texture that it cannot be effectively loosened or broken down by a hydraulic ripper specified above. Testing to determine compliance with this classification shall be made when requested. All boulders or detached masses of solid rock larger than 2 cubic yards in volume will be classified as rock.

B. Suitable excavated materials conforming to the requirements of Section 4.0 shall be utilized in backfills. Unsuitable material within the limits of excavation shall be removed and disposed of as waste. Unsuitable material is defined as material that is greater than 2 inches in diameter, organic materials and debris of any kind, or any material that is protruding from the planar surface of the bottom of the pit, side slopes of the pit, and within the anchor trench. Unsuitable or excess excavated material shall be disposed of at Owner's designated waste locations.

C. The method of excavation shall not weaken surrounding areas or damage structures or parts thereof that are completed or under construction. Existing structures and utilities adjacent to excavations shall be protected and supported to

prevent displacement.

D. Excavations shall conform within the tolerances specified to the lines, grades, sections and elevations shown on Design Drawings.

E. Except as otherwise shown, grading tolerances shall be zero to minus 4 inches for horizontal and sloped planes of excavation in earth and zero to minus 6 inches for horizontal and sloped planes excavation in rock.

F. Over-excavated areas within the pit area shall be restored with properly compacted drill cuttings to the elevations shown on Design Drawings. Compaction equipment shall be suitable for the size and depth of the holes being filled.

G. If any areas outside of the pit area are over-excavated in rock, the over-excavation shall be restored by backfilling spaces under and adjacent to footings, foundations or other bearing portions of structures with concrete having a 28-day compressive strength of 2000 psi. Restoration of over-excavated areas in rock and soil shall provide uniform bearing values at least equivalent to that previously given by the excavation prior to the over-excavation.

H. Areas being excavated and areas to be backfilled shall be maintained in a clean condition free from debris.

I. Compaction shall be "Ordinary compaction" without field testing but shall require close observation to ensure that the materials are being densified and that no soft or loose spots remain. Loose lifts shall be no more than six inches in thickness prior to compaction. Care must be taken to ensure that tracks compact evenly and do not 'bridge' between hard points leaving uncompacted material between. Tracked equipment exerts fairly low ground pressures but may be suitable for this project if closely observed. For reference the following equipment exerts pressure on the soil.

i. D8 Tractor with standard track and dozer Ground pressure is 1884 pounds per square foot (13.1 psi).

ii. 345 D Hydraulic excavator with 36" track Ground pressure is 1163 pounds per square foot (8.1 psi).

11.0 PIPE TRENCH EXCAVATION

A. The pipeline route for the leak detection system shall be excavated so that the pipe rests in a trapezoidal trench, as indicated on the Design Drawings. The bottom and sides of the trench shall be finished as smooth as the pit subgrade with similar surface treatment. The 8 oz non-woven textile liner shall wrap around the outside

of the gravel sump. The bottom geocomposite cushion and 24 mil RPE liners shall deform into the trench beneath the 8 oz non-woven textile liner. The geocomposite conduction liner shall continue over the top of the pit until the reaching the pipe and shall also be positioned underneath the pipe, as indicated on the Design Drawings. Ensure that the primary geomembrane liner is not significantly deformed over the pipe. Backfill around the pipe with clean drill cuttings.

B. The leak detection sump shall be excavated so as to provide the cover, bedding depth and minimum width of 4 feet as shown on the drawings.

C. The bottom of the pit shall be graded to drain to the leak detection system sump as indicated on the Design Drawings.

D. The method of excavation shall not weaken surrounding areas or damage structures or parts thereof that are completed or under construction.

E. All excavation shall conform within the tolerances specified to the lines, grades, sections and elevations shown on drawings and shall be shaped on the bottom to the bedding details shown to provide uniform bearing and support of each pipe section for the entire length.

F. In all excavation requiring blasting, care shall be taken to minimize overbreak. Material outside the authorized cross section, which has been shattered or loosened by blasting, shall be removed.

G. Precautions shall be taken so as not to excavate below the depths indicated on the drawings. Where excessive or unauthorized excavation occurs, backfill the depth to the proper grade with compacted sand and or pea gravel or other suitable material.

H. Except as otherwise shown, grading tolerances shall be plus zero to minus 4 inches for rippable rock excavation.

I. Remove excavated material not required or suitable for backfill from the excavation area and dispose of it at an onsite, designated location.

12.0 PIT SURFACE TREATMENT

A. Benching of Sloped Surfaces

Pit side slopes will be no steeper than 2 to 1 (horizontal to vertical) as indicated on Design Drawings. Tolerance for side slopes will be 2 inches in a 4 foot length of straight edge provided the transitions are smooth curves.

B. Surface Preparation:

Existing rippable hard material on the exposed surface of the pit bottom and side slopes shall be reduced in size to a maximum of 2 inches in diameter. Ensure that there are no rock protrusions above the planar surface of the pit bottom, side walls, and anchor trench. Reduction of this rock shall be done with the most appropriate means and methods available, such as tracking over the rock with the dozer, the use of ripper attachments on excavators, and/or the use of compaction equipment. Large or very hard materials which are resistant to crushing with available equipment may require removal or reduction with special equipment.

C. Filling Holes, Depressions and Cavities

Depressions and other cavities shall be filled in with clean drill cutting to the elevations of the pit bottom and side slopes indicated on the Design Drawings. Crushed rock less than 2 inches in diameter may also be used to fill in holes, depressions, and cavities. Compaction equipment shall be suitable for the size and depth of the holes being filled.

13.0 ANCHOR TRENCHES

A. Geosynthetic runout and anchor trench shall be constructed to the dimensions as indicted on Design Drawings. The subgrade surface of the anchor trench runout shall be of the same material as the side slope of the pit and will be smooth for placement of the liner system. Subgrade will be approved by the onsite engineer prior to placement of geosynthetics.

B. Class 2 Backfill as defined in Section 4.0 shall be used to backfill over the geosynthetic runout and in the anchor trench. Class 2 Backfill shall be used on top of the geosynthetic runout to a minimum depth of 12 inches and will match existing depth and grade as indicated on Design Drawings.

C. Backfill within anchor trench and over geosynthetic runout shall be placed in 6-inch lifts and wheel or bucket compacted with onsite equipment. Tolerance for final grade over runout and anchor trench shall be minus zero to plus 2 inches. Compaction efforts will be observed and approved by the onsite engineer to ensure sufficient compaction in required lifts.

14.0 STOCKPILING

A. As part of earthwork operations, stockpiling of excavated or borrowed material may be required.

B. Different classes of material shall be stockpiled separately if required by Owner.

C. Stockpiles and waste material shall be placed in such a manner to provide natural drainage and a stable embankment as approved by Owner.

D. Stockpiles shall be constructed with maximum height not exceeding 40 feet.

E. Location of stockpiles to be determined by Owner.

15.0 RESHAPING AND GRADING EXISTING IMPROVEMENTS

A. Prior to commencing finish grading, existing improvements shall be checked for their compliance with rough grading requirements shown on design drawings and restored to original lines, grade and cross section if required.

B. Clean and reshape previously constructed ditches of sedimentation and debris to original lines, grade and cross section.

C. Clean all previously constructed culverts of sedimentation and debris.

16.0 FINISH GRADING TOLERANCES

A. The finish grade tolerance for the rippable rock shall be plus zero and minus 4 inches to the lines and grades as indicated on the Design Drawings.

B. Areas not within the allowable tolerances shall be corrected by breaking, scarifying, placing additional material, remixing, and reshaping to the specifications herein.

17.0 CLEANUP

A. Leave area in a clean and neat condition. Grade all disturbed surfaces to prevent standing surface water.

1.0 GENERAL

A. This specification establishes the quality of materials and workmanship and defines how quality is measured for geosynthetic materials to be manufactured and installed for the B-16 Drill Pad at the Roan Plateau, Garfield County CO.

B. The word "Owner", as used here, shall mean Conoco Phillips.

C. Measurement shall be made of the total surface area in square feet covered by the geosynthetic. Final quantities will be based on as-built conditions. Allowance will be made for geosynthetic in anchor and drainage trenches; however, no allowance will be made for waste, overlap, repairs, or materials used for the convenience of the Contractor.

4.0 SUBMITTALS

A. Shop Drawings

1. Geomembrane panel layout and penetration detail drawings.

B. As-Built Drawings

1. Final as-built drawings of geomembrane installation.

C. Product Data

1. Tests, Inspections, and Verifications – Manufacturer's and fabricator's QC manuals.

2. Field Seaming – Installer's QC manual.

3. Qualifications

   a. Manufacturer's, and fabricator's qualification statements, including resumes of key personnel involved in the project.

   b. Installer's, QC inspector's, and QC laboratory's qualification statements including resumes of key personnel involved in the project.

   c. The submittal from the QC laboratory shall include verification that the laboratory is accredited via the Geosynthetic Accreditation Institute's Laboratory Accreditation Program (GAI-LAP) for the tests the QC laboratory will be required to perform.

4. Samples – Geomembrane QA and QC samples.

5. Test Reports

   a. Materials – Manufacturer's certified raw and sheet material test reports and a copy of the QC certificates.

   b. Surface Preparation – Certification from the QC inspector and installer of the acceptability of the surface on which the geomembrane is to be placed, immediately prior to geomembrane placement.

   c. Non-Destructive Field Seam Continuity Testing – QC inspector certified test results on all field seams.

   d. Destructive Field Seam Testing – Installer and certified QC laboratory test results on all destructively tested field seams.

   e. Destructive Seam Test Repairs – QC inspector certified test results on all repaired seams.

   f. Interface Friction Testing - Certified laboratory interface friction test results including description of equipment and test method.

   g. Tests – Certified QC test results.

5.0 QUALIFICATIONS

A. Manufacturer – Manufacturer shall have produced the proposed geomembrane sheets for at least 5 completed projects and a minimum total area of 10 million square feet.

B. Fabricator – The fabricator is responsible for seaming geomembrane sheets into panels. Fabricator shall have fabricated the proposed geomembrane panels for at least 5 completed projects and a total area of 2 million square feet.

C. Installer – The installer is responsible for field handling, deploying, seaming, anchoring, and field Quality Control (QC) testing of the geomembrane. The installer shall have installed the proposed geomembrane material for at least 5 completed projects, for a minimum total area of 2 million square feet. At least one seamer shall have experience seaming a minimum of 500,000 square feet of the proposed geomembrane using the same type of seaming equipment and geomembrane thickness specified for this project.

D. QC Technician – The QC inspector is the person or corporation hired by the Owner, who is responsible for monitoring and documenting activities related to the QC of the geomembrane from manufacturing through installation. The QC inspector shall have provided QC inspection during installation of the proposed geomembrane material for at least 5 completed projects having a total minimum area of 2 million square feet.

E. QC Laboratory – The QC laboratory shall have provided QC and/or Quality Assurance (QA) testing of the proposed geomembrane and geomembrane seams for at least five completed projects having a total minimum area of 2 million square feet. The QC laboratory shall be accredited via the Geosynthetic Accreditation Institute's Laboratory Accreditation Program (GAI-LAP) for the tests the QC laboratory will be required to perform.

6.0 MATERIALS

A. Geocomposite

1. Geocomposite Manufacturer's Quality Control

a. The geocomposite material to be used for lining the pond shall be a double sided geotextile-geonet geocomposite. The bottom geocomposite layer is to act as cushion and gas vent and the top one as a leak detection layer.

b. The polymer used to manufacture the geonet core of the geocomposite shall be polyethylene which is clean and free of any foreign contaminants.

c. Regrind material, which consists of edge trimmings and other scraps, may be used to manufacture the geonet; however, post consumer recycled material shall not be used.

d. The drainage core of the geocomposite shall be manufactured by extruding three sets of polyethylene strands to form a triaxial void maintaining structure consisting of a thick vertical rib with diagonally placed top and bottom ribs. The geonet shall meet the property requirements listed in Table 1.

e. The geotextile of the geocomposite shall be high UV resistant, continuous filament which is a needle punched, nonwoven polypropylene geotextile. The strength retained after 500 hours of UV exposure shall be at least 95% per ASTM G154. The filter and cushioning properties of the geotextile shall meet the property requirements listed in Tables 2 and 3.

2. Geonet Material Properties.

The Geonet Layer shall conform to the following material properties:

Table 1: Required Geocomposite Material Properties

TESTED PROPERTY	TEST METHOD	FREQUENCY	MINIMUM AVERAGE ROLL VALUE[d]		
Geocomposite			**6 oz/yd²**	**8 oz/yd²**	**10 oz/yd²**
Product Code			F420600605	F420800805	F421001005

Maximum Use Temperature		180° F	180° F	180° F	180° F	180° F	180° F
Minimum Use Temperature		-70° F	-70° F	-70° F	-70° F	-70° F	-70° F

Note: Minimum Roll Averages are set to take into account product variability in addition to testing variability between laboratories.
MD stands for machine Direction and DD for Diagonal Direction.

B. Geomembranes (24 mil Primary and 36 mil Secondary RPE)

1. Geosynthetics Manufacturer's Quality Control

a. The geomembrane liner shall be a four layer reinforced laminate containing no adhesives.

b. The outer layers of the RPE shall consist of a high strength polyethylene film and shall be resistant to ultraviolet rays in exposed applications.

c. The manufacturer of the liner shall take random samples of the liner material from each fabricated roll during manufacturing. Samples shall be tested by methods specified within this Section, or applicable ASTM standards, for thickness, strength, tear resistance, low temperature impact density and dimensional stability. Each roll of material shall be clearly identified and correlated to the test results provided.

d. The geomembrane manufacturer shall confirm in writing, that the geosynthetics to be furnished will be free of defects in materials and workmanship at the time of sale, and against deterioration due to the effects of ozone, ultraviolet or other normal weathering on a pro-rata basis. The geomembrane manufacturer shall furnish a sample warranty during the submittal process for review and approval prior to shipment. In addition, the manufacturer shall provide a minimum warranty against material failure of 15 years in case of the 24 mil RPE and for a minimum of 20 years for the 36 mil RPE.

2. RPE Material Properties

The material provided as Reinforced Polyethylene (RPE) liner shall conform to the following standards or approved equivalent:

7.0 INSTALLATION

A. Geocomposite

1. Prior to deployment of the geocomposite, the geosynthetics contractor shall inspect, certify, and accept, the subgrade on which the liner is to be placed to ensure conformance with the specifications. Surfaces not in compliance with the specifications shall be rectified by the earthwork Contractor.

2. The geocomposite layer shall be handled in such a manner as to ensure that it is not damaged in any way. On slopes, the material shall be anchored in the anchor trench and then rolled down the slope in such a manner as to continually keep the material under tension.

3. In the presence of wind, the leading edge of the material shall be weighted with sandbags or ballasts until the final cover is placed.

4. Care shall be taken to assure that any underlying layers are not damaged during placement. Low ground pressure machines such as ATVs are recommended to facilitate deployment over the geosynthetic layers. Low ground pressure machines shall be used when carrying a driver weighing approximately 150 lbs.

5. The bottom geocomposite layer is to act as cushion and gas vent and the top one as a leak detection layer. The bottom layer is to be placed along the slope of the bottom of the pit so it conforms to the shape of the pit bottom or as directed by the field engineer.

B. Geomembrane (Primary and Secondary RPE)

1. Prior to deployment of geomembrane, the geosynthetics contractor shall inspect, certify and accept, all surfaces on which the liner is to be placed to ensure conformance with the specifications. Surfaces not in compliance with the specifications shall be rectified by the geosynthetics contractor.

2. The amount of geomembrane liner deployed without final quality control and final repairs being completed shall not exceed 100,000 square feet. In addition, no seams shall be left unwelded and no openings in the liner shall be left at the end of a shift unless approved by the field engineer. The liner shall be placed over the prepared surface using methods and procedures that ensure a minimum of handling. The geosynthetics contractor shall provide adequate temporary anchoring devices to prevent damage due to wind.

3. Handling and storage of liner material shall be in accordance with the manufacturer`s printed instructions. All persons walking or working on the geomembrane shall wear soft-sole shoes.

4. The liner shall be installed in a relaxed condition and shall be free of tension or stress upon completion of the installation. All necessary precautions, including provisions for installing extra material, shall be taken to avoid trampolining of liner which will remain exposed (i.e., pad, pond corners and solution channels).

5. Horizontal field seams on slopes should be kept to a minimum. Seams shall be made by lapping the uphill material over the downhill material with sufficient overlap. A minimum of five feet is to be allowed from the toe of the slope to any horizontal seam on flat areas.

6. Installation shall be performed under the direction of a superintendent who has installed a minimum of 10,000,000 square feet of HDPE or LLDPE flexible lining material. The superintendent shall be provided by the geosynthetics contractor and shall be in charge of the installation.

7. Extreme care shall be taken by the geosynthetics contractor in the preparation of the areas to be welded. The area to be welded shall be cleaned and prepared according to approved procedures, and all sheeting shall be welded together by thermal methods.

8.0 FIELD SEAM INSPECTION AND TESTING

A. Geocomposite

1. Each component of the geocomposite (geotextile(s) and geonet) shall be secured or seamed to the like component at overlaps.

2. Adjacent edges of geonet along the length of the geocomposite, shall be overlapped 2-3 inches or as approved by the Engineer based on the site specific conditions, placed with the edges of each geonet butted against each other. These overlaps shall be joined by tying the geonet cores together with white or yellow cable ties or plastic fasteners. These ties shall be spaced at a maximum of every 10 feet along the roll length.

B. Geomembrane (Primary and Secondary RPE)

1. A maximum effort shall be made to install a perfect liner. This means that all seams completed in the field patches, and extrusions shall be inspected, tested, and recorded.

2. The welding equipment used shall be capable of continuously monitoring and controlling the temperatures in the zone of contact where the machine is actually fusing the lining material in order to ensure that the integrity of the weld is not affected by changes in weather conditions.

3. No "fish mouth" shall be allowed within the seam area. Where "fish mouths" occur, the material shall be cut, overlapped, and extrusion welded. Welds on completion of the work shall be tightly bonded. Any membrane area showing distress due to excessive scuffing or puncture from any cause shall be replaced or repaired.

4. The geosynthetics contractor shall take into account that rapid weather changes are very possible, resulting in delays in construction of field seams. Joining of panels and repairs will only be permitted under weather conditions allowing such work within the warranty limits imposed by the manufacturer.

5. A quality-control technician shall inspect each seam, marking his initials and the date inspected at the end of each panel. Any area showing a defect shall be marked and repaired in accordance with approved repair procedures.

6. The field installation testing program shall consist of periodic visual observations, continuity, and strength tests. These inspections and tests are to be made routinely and are automatic regardless of other types of testing required. The program shall include:

a. Visual Observations

- To perform visual check field seams for squeeze out, footprint, melt and overlap.
- Machines to be checked for cleanliness.
- Any area of the seam or panel showing a defect shall be marked and repaired in accordance with the applicable repair procedures.

b. Non Destructive Testing

A 48 inch (1.2 m) sample should be taken from each factory seam welding unit used in this work at the beginning of every work shift an every four hours of production thereafter. Samples shall be nondestructive, not requiring patching of fabricated panels. Test specimens shall be cut at quarter points from each 48 inch seam sample (a total of three places) and tested for seam strength and peel adhesion. The shear seam strength shall be tested in accordance with ASTM D751 modified method and peel adhesion will be tested in accordance with ASTM D413, Machine Method, Type A. A log shall be maintained showing the date, time, panel number and test results. Failure of the material and/or seams to meet all the requirements of these specifications may be cause for rejection of the RPE material and/or seams as appropriate. The fabricator shall provide the test results to the owner or engineer upon request. The results of the leak test shall be marked at the location and shall be recorded by the geosynthetics contractor. If the test fails, the location of the leak shall be found and repaired or the entire seam shall be repaired and retested.

c. Strength Testing

1. For trial welds, the following procedure is to be used:

- Trial welds shall be completed under the same conditions and using the same materials, pre-seaming, and seaming techniques as used to fabricate field seams. The trial weld samples shall be a minimum of 3 feet long by 1 foot wide, marked with the date, technician's name, ambient temperature, and welding machine number and temperature. Coupons from the test weld shall be tested for peel and bonded seam strength using a calibrated tensiometer, as well as thickness, in accordance either the applicable ASTM or NSF 54 standards as appropriate. If failing results occur, the welding machine shall be repaired or replaced and retested.

- The minimum frequency for obtaining trial weld samples from each of the welding machines in operation is the following:
    - Prior to the beginning of seaming operations.
    - After every four hours of seaming operations.
    - After repairs have been made to seaming equipment.
    - By each technician using the seaming equipment.
    - As required by the Owner.

d. Destructive Testing

1. For destructive testing of field seams the following procedure is to be used:

- Destructive samples may be obtained from field seams or repaired areas by cutting perpendicular to the seams. The sample should be approximately 2 feet long by 1 foot wide. This sample shall be cut into two samples of 1 foot by 1 foot and labeled with the welder's identification, date, and location. One of the samples will be retained by the Owner and one of the samples will be tested by the Geosynthetics Contractor, using a calibrated tensiometer, in accordance with the applicable ASTM or NSF 54 standards as appropriate.

- The frequency for obtaining destructive test samples shall not be less than one sample per 750 feet of field seam. Coupons from the destructive sample shall be tested for peel and bonded strength as well as thickness, in accordance with the applicable ASTM standards. If one or more of the coupons fails, the sample will be considered a failure. As far a practicable, samples should be taken from above the water level in the pond or from the anchor trench to minimize repair within the water bearing surface.

- In the event of a failing test result, additional samples, on either side of the failure, shall be tested to isolate the portion of the seam which needs to be repaired, and the failed portion of the weld shall be "capped". Alternatively, the entire seam can be rewelded and retested.

END OF SECTION 02530

ConocoPhillips
B-16 PRODUCED WATER PIT RE-DESIGN
CIVIL CONSTRUCTION PLANS

A PORTION OF
SECTION 16, T5S, R96W, 6TH P.M., NW 1/4 NE 1/4

GENERAL SPECIFICATION NOTES:

1. THE CONTRACTOR SHALL HAVE AT LEAST ONE (1) SIGNED COPY OF THE PLANS & SPECIFICATIONS ON THE JOB SITE AT ALL TIMES.
2. THE COORDINATE SYSTEM AND THE TOPOGRAPHY SHOWN ON PLANS ARE PER "UINTAH ENGINEERING AND LAND SURVEYING." SURVEY OF JANUARY 17, 2008.
3. ALL ELEVATIONS AND SLOPES SHOWN ON THE SAMUEL ENGINEERING INC. PLANS ARE TO TOP OF FINISHED GRADE (F.G. OR P.G.) AT THE SURFACE COURSE. ALL CUT SLOPES ARE 3:2 AND ALL FILL SLOPES ARE 2:1 UNLESS NOTED OTHERWISE.
4. THE CONTRACTOR SHALL NOTIFY THE "UTILITY NOTIFICATION CENTER OF COLORADO," AT 811, 1-800-922-1897 OR WWW.UNCC2.ORG. FOR CURRENT UTILITY LOCATION INFORMATION AT LEAST 72 HOURS PRIOR TO BEGINNING ANY EXCAVATION.
5. DURING THE CONSTRUCTION THE CONTRACTOR SHALL MAINTAIN A DUST CONTROL PROGRAM WHICH SHALL INCLUDE WATERING OF ALL DISTURBED AREAS.
6. ALL STORM SEWER (STS) PIPE AND FITTINGS SHALL BE CORRUGATED METAL PIPE (CMP), GALVANIZED, AND OF 26 GAGE STEEL.
7. THE CONTRACTOR SHALL MAINTAIN POSITIVE DRAINAGE AND PROVIDE THE REQUIRED EROSION CONTROL MEASURES AT THE PROJECT SITE AT ALL TIMES.
8. EXCAVATION SHALL BE AS NEARLY VERTICAL AS POSSIBLE. SHEET AND SHORE IF SOIL CONDITIONS REQUIRE
9. NO CONCRETE SHALL BE PLACED UNTIL THE SUBGRADE IS INSPECTED BY THE ENGINEER.
10. ALL BURIED STRUCTURES, PIPES AND ALL APPROVED MATERIAL SUBSTITUTIONS SHALL BE CAPABLE OF A MINIMUM OF HS-20-44 LOADING.
11. IF OBSTRUCTION SUCH AS INLETS, UTILITY POLES, FIRE HYDRANTS, ETC. ARE ENCOUNTERED THE LOCATIONS OF WATER OR SEWER ROUTES MAY BE ADJUSTED UPON APPROVAL OF THE ENGINEER.
12. VERTICAL CLEARANCE BETWEEN WATER LINES AND ALL OTHER EXISTING OR PROPOSED SANITARY OR STORM SEWERS, GAS, TELEPHONE, TV AND ANY OTHER LINES SHALL BE 18."
13. ALL CONCRETE SHALL HAVE A MINIMUM 28 DAY COMPRESSIVE STRENGTH OF 3,000 PSI
14. NO DISTURBANCE OF EXISTING CONDITIONS SHALL OCCUR WITHIN 15 FEET OF PROPERTY BOUNDARY
