COGCC recommends that the latest version of EPA SW846 analytical methods be used where possible and that analyses of samples be performed by laboratories that maintain state or national accreditation programs.

1 Consideration shall be given to background levels in native soils and ground water.

2 Concentrations taken from CCPHE-HWMID Table 1 Colorado Soil Evaluation Values (December 2007).

3 Concentrations taken from CCPHE-HWMID Regulation 41 - The Basic Standards for Ground Water. For this range of standards, the first number in the range is a strictly health-based value, based on the WQCC's established methodology for human health-based standards. The second number in the range is a maximum contaminant level (MCL), established under the Federal Safe Drinking Water Act, which has been 000.22 As of April 1, 2003 300.25 As of April 1, 2009.

As determined to be an acceptable level of this chemical in public water supplies, taking treatability and laboratory detection limits into account. The WQCC intends that control requirements for this chemical can be implemented to attain a level of ambient water quality that is at least equal to the first number in the range except as follows: 1) where ground water quality exceeds the first number in the range due to a release of contaminants that occurred prior to September 14, 2004 (regardless of the date of discovery or subsequent migration of such contaminants) cleanup levels for the entire contaminant plume shall be no more restrictive than the second number in the range or the ground water quality resulting from such releases, whichever is more protective, and 2) whenever the WQCC has adopted alternative, site-specific standards for the chemical, the site-specific standards shall apply instead of these statewide standards.

Analysis by USDA Agricultural Handbook 50 method (2013) with soluble cations determined by method (2). Method (2) = estimation of exchangeable sodium percentage and exchangeable potassium percentage from soluble cations. Method (2) = saturated paste method (note each analysis requires a unique sample of at least 500 grams). If soils are saturated, USDA Agricultural Handbook 60 with soluble cations determined by method (3A) saturation extraction method.

4 The table value of these inorganic constituents is taken from the CCPHE-HWMID Table 1 Colorado Soil Evaluation Values (December 2007). However, because these values are high, it is possible that site-specific geochemical conditions may exist that could allow these constituents to migrate into ground water at levels exceeding ground water standards even though the concentrations are below the table values. Therefore, when these constituents are present as contaminants, a secondary evaluation must be performed to ensure ground water protection.
