

Area of interest is **SENE, Section 28-T1N-R67W** – Proposed NGL C2A Facility & Wellhead.

According to the COGCC Mapping Tool: Water Resources / Lakes layer - shows a "pond" at this site. But IPT and Acklam Surveying have both inspected this site during a stretch of 2 weeks of heavy rains and on 5/20/2015 there was no standing water anywhere on this proposed facility and well pad site. Evidently, over the years, the farmers via plowing & re-contouring have made this area high ground which drops off just north of this site going further north and downhill to a levee and then a stream. Even USGS Topos still show a pond - but there definitely is no longer a possibility of one at this location - even after heavy rains. Based upon this data we request this site not be listed in a riparian area.
