Bybee 14-L Facility Irrigation Ditch culverts

Dear Mr. Smith,

Per the comments on the final drainage report contained in the Development Review Committee Report for the Bybee 14-L facility, you requested that Extraction Oil & Gas obtain approval to install culverts in the two irrigation ditches to the east of the site from the owner of these ditches. We have identified that the Lower Boulder Ditch Company owns these ditches, and Extraction is currently in the process of obtaining a letter of approval from them. Since we have performed all necessary calculations and design work showing that these culverts will be sufficient to convey the full flow of these ditches and this information has been passed along to the ditch owner, we are requesting that you conditionally approve the Final Drainage Report for the Bybee 14-L Facility with the approval letter from the ditch owner to be included for the final approval.

Sincerely,

Petroleum Field Services, LLC.

Michael C. Welker, PE, CFM

Project Engineer

Re: Bybee 14-L Facility

Dear Mr. Smith,

Petroleum Field Services (PFS) has completed a final drainage report for the Bybee 14-L Facility located 2200 feet north of county road 20/Bella Rosa Parkway and 950 feet west of Silver Birch Boulevard.

This report is prepared in accordance with the *Urban Storm Drainage Criteria Manual Volumes 1-3* (USDCM). Since the Bybee 14-L Facility is located within the Godding Hollow Basin as shown in in the Basin Map located in Appendix A, the report was also prepared in accordance with the South Weld I-25 Corridor Master Drainage Plan. The site includes a WQ feature that incorporates water quality measures in accordance with the USDCM and an emergency spillway that releases stormwater from larger storms to the surrounding field following historic patterns. Therefore, the design of the proposed Bybee 14-L Facility is in compliance with the Town of Frederick, UDFCD stormwater criteria as well as the South Weld I-25 Corridor Master Drainage Plan.

We look forward to your consideration of and feedback on this Final Drainage Report. If you have any further questions or comments, please contact our office at 303-928-7128 or by email at mwelker@petro-fs.com.

Sincerely,

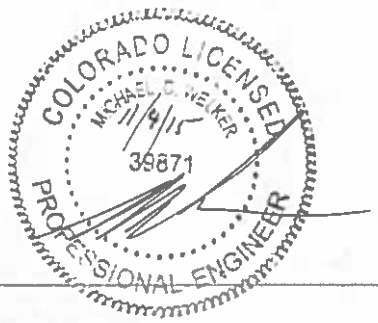
Petroleum Field Services, LLC.

Michael C. Welker, PE, CFM

Project Engineer

Certification of Engineering

I hereby certify that this report for the final drainage design of the Bybee 14-L Facility was prepared by me (or under my direct supervision) in accordance with the provisions of the Urban Drainage and Flood Control District Storm Drainage Criteria and supplemental Town of Frederick requirements for the owners thereof.



Michael C. Welker,

Registered Professional Engineer

State of Colorado No. 39871

Contents

1. General Location and Description

1.1. Location

The Bybee 14-L Facility is located in the North ½ of the Southeast ¼ of Section 14, Township 2 North, Range 68 West of the 6th Principal Meridian, Town of Frederick, County of Weld, State of Colorado. It is physically located about 2000 feet north of Weld county road 20/Bella Rosa Parkway, 900 feet west of Silver Birch Boulevard and 3800 feet east of Interstate 25 (see Vicinity Map in Appendix A for exact location).There are irrigation ditches located immediately to the north, east and west of the site and the Godding Hollow major drainageway flows from south to north approximately 350 feet to the west of the site. The main surrounding developments include a well pad approximately 50 feet to the northwest of the site, the Stone Ridge housing development 1000 feet to the northeast, a single family residence 800 feet to the northeast and farming facilities approximately 1000 feet to the southwest.

1.2. Description of the Property

The proposed site is approximately 4.02 acres in area and consists of a well pad that will be partially reclaimed. The permanent pad with an area of 4.0 acres will be repurposed to operate and maintain oil production facilities. The facilities will consist of two water tanks, 16 oil tanks, eight separators, 12 ECD's a vapor recovery tower and a sales meter. There will be a topsoil stockpile located along the south edge of the reclaimed portion of the pad.

Drainage facilities, including a water quality feature, emergency spillway and infiltration bed are proposed on the south side of the production facility pad. A combination of swales and berms are proposed along the perimeter of the production facility pad to redirect offsite stormwater around the site, and collect developed onsite stormwater.

As determined by the USDA Web Soil Survey, the historical soil on this site is Vona sandy loam. The hydrologic soil group is type A (see Hydrologic Soils Map in Appendix A). The historical site generally slopes from the east to the west with slopes ranging from 1 to 3%. The historical site has a percent imperviousness of 2%. Upon completion of development the proposed site will be a combination of native planted areas, compacted gravel and drives and walks. The composite percent imperviousness will be 51.00% (see calculations in Appendix B for details).

2. Drainage Basins and Sub-Basins

2.1. Major Basin Description

The proposed site is located within the Godding Hollow basin as defined in the South Weld I-25 Corridor Master Drainage Plan (see Basin Map in Appendix A), thus the South Weld I-25 Corridor Master Drainage Plan was consulted during the design of the drainage facilities for the proposed site. The Godding Hollow basin is located in the Southwest corner of Weld County, bounded by The Saint Vrain River to the North, Weld County Road 7 to the West and WCR 8 to

the South. The tri-town basin lies directly to the East of the Godding Hollow Basin and makes up its eastern border. The total area of the basin is 12,419 acres, 11% of which was developed as of 2000. The primary drainage feature of the basin is the Godding Hollow channel which runs through the center of the basin. This channel begins southwest of the intersection of Weld County road (WCR) 10 and I-25. From this starting point, the channel initially bears northeast, crossing under I-25, and then heads north until it drains into the Saint Vrain River (see "South Weld I-25 Corridor Master Drainage Plan" for full details of this basin).

Irrigation ditches are located directly north, east and west of the proposed site and the aforementioned Godding Hollow major drainageway is located to the west of the site approximately 350 feet. Due to the proposed swales and berms that will surround the facility pad, developed stormwater will flow away from these ditches. As indicated by the Weld County FEMA Map Index, the proposed site is within Panel Number 080266-0861C, panel 861 of 1075, dated September 28, 1982 (please see FEMA Firmette in Appendix A). The Bybee 14-L facilities are shown to be located within Zone C, which is defined by FEMA as an area of minimal flooding.

2.2. Sub-Basin Description

Stormwater historically drains from the east to west across the proposed site based upon topographic maps provided in the South Weld I-25 Corridor Master Drainage Plan. According to topographic data collected for the grading of this site, the proposed pad will be located on top of an existing low point within the field where water currently collects. Therefore, offsite stormwater will flow from all directions towards the proposed pad.

The proposed site is surrounded by a single offsite basin. This offsite basin is bounded by the high points of the irrigation ditch berms to the north and west, by existing topography to the South and by the edge of Silver Birch Boulevard/WCR 11 to the East containing a total area of 30.63 acres. Please see Appendix A8 – Basin Map for the extents of this basin. Offsite stormwater from this basin will be directed around the site by berms along all cut slopes.

The edge of the facility pad forms the extents of the onsite drainage basin for the proposed site. The developed stormwater from this basin will be collected via swales to the north, west and south and carried to a water quality feature along the south edge of the pad. From this water quality feature, stormwater will either be released through a water quality outlet structure along the western edge of the feature, or will be allowed to drain into an infiltration bed below.

2.3. Summary Table

Refer to Appendix B for the summary tables.

3. Drainage Design Criteria

3.1. Regulations

Due to the flat topography of the surrounding field, and the existing low point that the site is located in, the proposed drainage features will include a water quality feature in place of the typically required detention pond.

3.2. Development Criteria Reference and Constraints

Since the proposed site is located within the Godding Hollow major basin, the South Weld I-25 Corridor Master Drainage Plan was consulted.

In its existing condition, stormwater from the site would pool at the low point in the field. After construction of the proposed site, developed onsite stormwater will be directed to the water quality pond. Once collected in this pond, the developed stormwater will be released to the surrounding field either through the water quality structure in the event of a smaller storm, or through the emergency spillway in the event of a larger storm. Additionally, a portion of the developed flow will drain into the infiltration trench below the pond where it will infiltrate into the ground.

Prior to the partial reclamation of the well pad, the site will contain two modular large volume tanks (MLVTs), to be used for well pad operations, located on the south side of the site. Due to the existing topography, if these tanks were to fail, the released water would initially pool around the site and would be contained by the irrigation ditches that surround the field the site is to be located in. In the event that the capacity of this surrounding catchment is exceeded, the remaining water would flow out of this surrounding catchment at a point to the northwest of the site towards the Godding Hollow drainage channel due to the slope of the surrounding land. Please see Appendix C31 – MLVT Failure Analysis for further details of this analysis.

3.3. Hydrological Criteria

This proposed drainage plan follows the *Town of Frederick Design Standards and Specifications* and the *Urban Storm Drainage Criteria Manuals (USDCM Volumes 1-3).* The minor and major design storm frequencies used for the detention pond design are 10 years and 100 years respectively. As indicated in the NOAA Atlas in Appendix A, the associated one hour point rainfalls are 1.39 inches for the minor (10 year) storm and 2.73 inches for the major (100 year) storm.

As the on-site basin is less than 160 acres (8.7 acres), the rational method was used to compute the runoff. The weighted percent imperviousness and runoff coefficient were calculated for the two basins using USDCM tables RO-3 and RO-4, and equations RO-6 and RO-7. The time of concentration was calculated using USDCM table RO-2 and equations RO-2, RO-3 and RO-4. For the onsite basin, equation RO-5 was used to check the calculated value for the time of concentration since the developed site acts similar to an urban environment and the smaller of the two calculated values was used.

The volume of the water quality pond was computed using the WQCV tab of the UDFCD UD-Denteion_v2.34 Spreadsheet considering a 40 hour drain time.

Please see Hydrological Computations in Appendix B for details.

3.4. Hydraulic Criteria

The hydraulic structures proposed on-site include a water quality pond, a water quality outlet structure, an emergency spillway, an infiltration bed below the water quality pond and a combination of swales and berms to direct offsite stormwater around the site and keep developed, onsite stormwater within the site.

The sizing of the water quality pond and emergency spillway were computed using the UDFCD UD-Denteion_v2.34 Spreadsheet. These hydraulic calculations include stage storage sizing for the water quality pond and stage-discharge sizing of the spillway. Since the water quality orifice plate, as designed, does not fit the requirements of the UDFCD spreadsheet (since there is less than one foot from the lowest set of orifices to the WQCV elevation due to site constraints) the sizing of orifices was calculated by hand using Bernoulli's equation and the continuity equation for incompressible, steady flow. The Water Quality trash screen size was calculated per USDCM V3 Chapter 4 Outlet Structures**.** The capacities of the two swales along the edges of the site were calculated using the UDFCD UD-Channels_v1.05 spreadsheet. Swale 1, which runs along the north and west edges of the pad, was evaluated at its midpoint and endpoint and swale 2, which runs along the south edge of the pad, was evaluated at its midpoint to ensure that they had adequate capacity to convey the portion of the full 100-year developed flow that they are designed to convey. Due to the topography of the site and surrounding field, it would be impractical for these swales to provide 1 foot of freeboard and still have enough slope to direct water to the pond; however, these calculations indicate they will provide 3" of freeboard. The culverts for the irrigation ditch where the proposed permanent access road crosses over them were sized using the UDFCD UD-Culvert_v3.03 spread sheet. Please see Hydraulic Computations in Appendix C for details.

4. Drainage Facility Design

4.1. General Concept

As mentioned in section 3.1 - Development Criteria Reference and Constraints, under existing conditions runoff around the site flows from all directions to the low point in the field. In order to maintain this existing pattern, the water quality feature and emergency spillway will release water to the west of the site at the surrounding low point.

The water quality pond for this site was designed to collect the full water quality capture volume and release it to the surrounding field with a drain time of 40 hours. A water quality orifice plate, located along the western edge of the pond in the middle of the emergency spillway, was designed to control this release rate, with a narrow channel running down the middle of the emergency spillway to convey this flow. In the event of a larger storm which exceeds the water

quality capture volume, stormwater will be channeled through the emergency spillway to the existing low point in the field. This emergency spillway was designed to convey the 100 year developed flow without overtopping.

In addition to the water quality orifice plate, an infiltration bed is proposed beneath the water quality pond to drain the remainder of the stored volume (primarily that volume which remains in the 0.55 feet below the water quality orifices). In order to design this infiltration trench, the EPA fact sheet regarding infiltration trenches (see reference 6) was consulted to determine that this site met the requirements for an infiltration trench/bed. Due to the hydrological soil type (type A) and depth to groundwater (over 6.5 feet) it was determined that this site did meet these qualifications. Between the water quality orifice plate and this infiltration bed, the full WQCV will be drained in less than the maximum drain time of 72 hours.

4.2. Specific Details

The depth of the proposed water quality pond is 1.3 feet with the top of the pond at the pad elevation of 4889.4'. The proposed water quality pond has a calculated storage volume of 0.094 acre-ft and is graded with a 4:1 interior side slope. The emergency spillway is located along the western edge of the pond at the WQCV elevation of 4889.1'.

The owner is responsible for maintaining the operation and access of the drainage facilities including the culverts proposed beneath the access road. The proposed detention pond can be accessed from WCR 20/Bella Rosa Parkway via the proposed on-site access road. The disturbed area of the detention pond will be re-seeded. Any vegetation should be trimmed. Any debris or trash from the trash grates attached to the outlet structure should be cleaned. Any blockage in the culverts, ditches, or outlet pipes should be removed to keep the drainage facilities at full capacity. The infiltration trench should be inspected and cleaned twice a year and following major storm events. The infiltration may need to be fully rehabilitated every 5 to 15 years.

4.3. Summary Tables

Refer to Appendix B and C for the summary tables.

5. Conclusion

The hydrologic and hydraulic calculations associated with the proposed drainage plan follow the *Urban Storm Drainage Criteria Manuals* (USDCM). These calculations show that the water quality feature is designed to contain the water quality capture volume and drain within 72 hours. The emergency spillway for this site will be able to convey the full 100 year developed flow without overtopping and direct it to the low point of the surrounding field. The design of the drainage facilities for this site have also taken into account the South Weld I-25 Corridor Master Drainage Plan, specifically in regard to maintaining historical drainage patterns. Thus, the Town of Frederick's stormwater requirements have been met and stormwater impacts due to proposed development have been mitigated.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Totals for Area of Interest			**4.0**	**100.0%**

Description

"Water table" refers to a saturated zone in the soil. It occurs during specified months. Estimates of the upper limit are based mainly on observations of the water table at selected sites and on evidence of a saturated zone, namely grayish colors (redoximorphic features) in the soil. A saturated zone that lasts for less than a month is not considered a water table.

This attribute is actually recorded as three separate values in the database. A low value and a high value indicate the range of this attribute for the soil component. A "representative" value indicates the expected value of this attribute for the component. For this soil property, only the representative value is used.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

WQ Orifice Sizing

The following is an analysis of the required size of the WQ orifices.
This analysis was performed by hand since the UDFCD spreadsheets do not work for the given configuration (less than 1.0 feet from the lowest, and only, orifice row to the WQCV elevation of 4889.1')

Properties

Height at WQCV, h_i	0.45 ft
Height at Orifice, h_0	0.0 ft
Area at WQCV, A(h = 0.45)	4873.40 sq ft
Area at Orifice, A(h = 0)	4157.15 sq ft
Coefficient of Discharge for Orifice, C_D	0.65
Required Drain Time, t	40 hrs

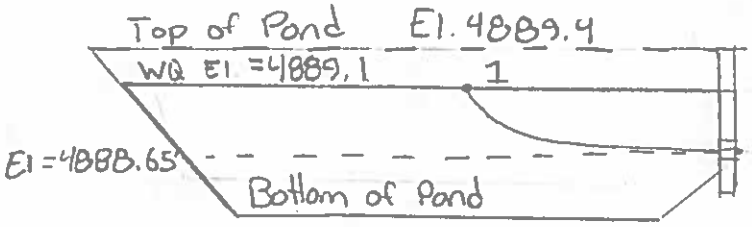
Results

Number of Orifices:	3	4
Required Radius:	0.346 in	0.300 in

Analysis

The above properties of the basin and orifice plate were used to calculate the required size of the orifices. Please refer to appendicies C4 and C5 for the complete calculations. From this calculation it was determined that four 3/5" diameter holes would be sufficient to drain the portion of the WQCV above these orifices in 40 hours. The remainder of the pond will drain through the infiltration trench within the next 32 hours (given that the entire pond needs to drain in 72 hours).

WQ Orifice Sizing



$V_1 << V_2 \rightarrow \frac{V_1^2}{2g} \approx 0$

$$\frac{P_1}{\gamma} + \frac{V_1^2}{2g} + z_1 = \frac{P_2}{\gamma} + \frac{V_2^2}{2g} + z_2$$ Bernoulli's Equation

$$h = \frac{V_2^2}{2g}$$

$$V_2 = \sqrt{2gh}$$

$Q_1 = V_1 A$

$Q_2 = C_d V_1 A$ C_d = coefficient of discharge = 0.65

$Q_1 = Q_2$

$V_1 A_1 = C_d V_2 A$ $V_1 = -\frac{dh}{dt}$

Area of Pond

$A(h)$ = Area, function of height

$A(0.45') = 4873.40\ ft^2$

$A(0) = 4157.15\ ft^2$

→ roughly linear

$A(h) = m \cdot h + A_0$

$A_0 = 4157.15\ ft^2$

$4873.4\ ft^2 = m(0.45\ ft) + 4157.15\ ft^2$

$m = 1591.7\ ft$

$A(h) = (1591.7\ ft)h + 4157.15\ ft^2$

$$-\frac{dh}{dt}\left[(1591.7\,ft)h + (4157.15\,ft^2)\right] = \sqrt{2gh}\ 0.65\ A, \quad K = 0.65\ A\sqrt{2g}$$

$$-\frac{1}{K}\int_{h_0 = 0.45\,ft}^{h_f = 0\,ft}\left[(1591.7\,ft)h^{1/2} + (4157.15\,ft^2)h^{-1/2}\right]dh = \int_0^t dt$$

$$-\frac{1}{K}\left[(1591.7\,ft)\frac{2h^{3/2}}{3} + (4157.15\,ft^2)2h^{1/2}\right]_{0.45}^{0} = t$$

$$-\frac{1}{K}\left[-(1591.7\,ft)^2\cdot\frac{(0.45\,ft)^{3/2}}{3} - (4157.15\,ft^2)\cdot 2(0.45\,ft)^{1/2}\right] = t$$

$$-\frac{1}{K}\left[-320.3\,ft^{5/2} - 5577.4\,ft^{5/2}\right] = t$$

WQ Orifice Sizing (continued)

$$t = \frac{5897.4\ ft^{5/2}}{K} = \frac{5897.4\ ft^{5/2}}{0.65 A \sqrt{2 \cdot 32.2\ ft/s^2}}$$

$$t = \frac{1130.6\ ft^2/s}{A}$$

For 40 hr = 144000 s drain time

$$144000 s = \frac{1130.6\ ft^2/s}{A}$$

$$A = 0.00785\ ft^2 \cdot \left(\frac{144\ in^2}{ft^2}\right) = 1.13\ in^2$$

$$A = n \cdot \pi R^2$$

$n = 3$ $\quad 1.13\ in^2 = 3 \cdot \pi R^2$ $\quad R = 0.346$ in

$D \approx 7/10$ in

$n = 4$ $\quad 1.13\ in^2 = 4 \cdot \pi R^2$ $\quad R = 0.300$ in

$D = 3/5$ in

Water Quality Trash Screen Sizing

Ref: UDFCD V3 Chapter 4 T-12 Outlet Structures Table OS-2a and OS-2b
The Diameter from WQCV Outlet Spreadsheet = 0.754 " < 1.25 "

Table OS-2a. Trash Rack Sizing for Small Circular Orifices (up to 1-1/4" diameter)[1,3]

Number of Columns	Diameter of Circular Orifice (in)	Width of Trash Rack Opening ($W_{opening}$) as a Function of Water Depth H Above Lowest Perforation				
		H=2.0'	H=3.0'	H=4.0'	H=5.0'	H=6.0'
1	≤ 1-1/4	12"[2]	12"[2]	12"[2]	12"	13"

For D < 1.25" and WQCV Depth H <2', the Min recommended width is 12"

[1] For use with Johnson VEE WireTM Stainless Steel Screen1 (or equivalent screen with 60% open area). Assumes inundation of well screen into the permanent pool 2'4".

[2] Represents the minimum recommended width of 12 inches, otherwise width is calculated based on Figure OS-1.

[3] This table provides the minimum opening in the concrete, not the minimum width of the well screen. Ensure the well screen is wide enough to properly attach to the structure.

Concrete opening = 2 ft > minimum 1 ft ==> OK

Table OS-2b. Trash Rack Specifications for Circular Orifice Plates

Max. Width of Opening (in)	Screen #93 VEE Wire Slot Opening (in)	Support Rod Type	Support Rod, On Center, Spacing	Total Screen Thickness	Carbon Steel Frame Type

[1] Johnson Screens, St. Paul, Minnesota, USA (1-800-833-9473)

Analysis of Open Channels

The following is an analysis of the flow capacity of the perimeter swales as they are graded.

Given the following calculated values for the proposed basin's 100-YR flow rate

Calculated Values: (See Appendix B-5)

Proposed basin 100-YR Developed flow rate: 11.26 cfs

Swale 1 Analysis

Swale 1 is designed to convey a portion of the developed flow from the proposed basin to the water quality pond equal to approximately one third of the total 100 year developed flow rate (assuming 1/3rd of developed flow is collected by each swale, and the final third flows across the pad directly into the pond). Swale 1 was evaluated at two points to account for the varying cross section that will be neccessary due to the need for a sloped swale across an essentially flat ground surface. These two points are the midpoint, where the required capacity is approximately 1/6th of the total developed flow, and at its endpoint where the required capacity is 1/3rd of the developed flow.

As was discussed with Adam Smith (representing the town of Frederick) the swales will not be able to provide the typically required 1.0 feet of freeboard due to site constraints.

The characteristics of swale 1 as designed are shown below:

Characteristics:	**Midpoint**	**Endpoint**
Depth of swale =	0.45 ft (3" of freeboard)	0.94 ft (3" of freeboard)
Slope of the swales =	0.0015 ft/ft	0.0015 ft/ft
Bottom width: B =	4.0 ft	4.0 ft
Slope of Swale sides =	4 ft/ft	4 ft/ft
Manning's Coefficient: n =	0.03	0.03
Required capacity =	1/6(11.26cfs)	1/3(11.26 cfs)
	= 1.88 cfs	= 3.75 cfs
Calculated Flow Capacity =	2.44 cfs	10.21 cfs

Conclusion

The above parameters were entered into the UD-Channels Spreadsheets to determine the water depth at the 100-YR flow rate. Please refer to Appendix C-9 , the Normal Flow Analysis Trapezoidal Channel: Swale 1 - Midpoint, and C-10, the Normal Flow Analysis Trapezoidal Channel: Swale 1 - Endpoint, for details. Based on this analysis, the flow capacity of swale 1 meets the required capacity at both design points with 3" of freeboard.

Swale 2 Analysis

Swale 2 is designed to convey a portion of the developed flow from the proposed basin to the water quality pond equal to approximately one third of the total 100 year developed flow rate (assuming 1/3rd of developed flow is collected by each swale, and the final third flows across the pad directly into the pond). Swale 1 was evaluated at its midpoint where the required capcity was considered to be the full 1/3rd of the proposed basin's flow.

As was discussed with Adam Smith (representing the town of Frederick) the swales will not be able to provide the typically required 1.0 feet of freeboard due to site constraints.

The characteristics of swale 2 as designed are shown below:

Characteristics:	**Midpoint**
Depth of swale =	0.6 ft (+3" freeboard)
Slope of the swales =	.002 ft/ft
Bottom width: B =	4 ft
Slope of Swale sides =	4 ft/ft
Manning's Coefficient: n =	0.030
Required capacity =	1/3(11.26 cfs)
	= 3.75 cfs
Calculated Flow Capacity =	4.85 cfs

Conclusion

The above parameters were entered into the UD-Channels Spreadsheets to determine the water depth at the 100-YR flow rate. Please refer to Appendix C-11 , the Normal Flow Analysis Trapezoidal Channel: Swale 2 for details. Based on this analysis, the flow capacity of swale 1 meets the required capacity at the design point with 3" of freeboard.

Analysis of Culverts

Analysis of Irrigation Ditch Culverts

The proposed culverts for the Irrigation ditches where the proposed permanent access road crosses them (at the northeast corner of the site) were sized to convey the full flow of the ditches. In order to calculate the full flow of the irrigation ditches, their cross sections and flow path were measured and entered into the UD-Channels Spreadsheet. Using these calculated flow rates, the culverts were then sized. Using the information from the sizing of the culverts, the required outlet protection was then determined.

Characteristics:	**Northeast Irrigation Ditch 1**	**Northeast Irrigation Ditch 2**
Depth of swale =	1.10 ft	1.31 ft
Slope of Ditch Flow Path =	0.0018 ft/ft	.0020 ft/ft
Bottom width: B =	0.7 ft	1.66 ft
Slope of West Side =	2 ft/ft	1.35 ft/ft
Slope of East Side =	1.5 ft/ft	1.31 ft/ft
Manning's Coefficient: n =	0.030	0.030
Calculated Full Flow capacity =	4.14 cfs	8.10 cfs
	NE IRD 1 Culvert	**NE IRD 2 Culvert**
Diameter of Culvert =	15"	15"
Inlet Edge Type =	Square Edge Projection	Square Edge Projection
Number of Barrels =	2	2
Inlet Elevation =	4891.6'	4894.1'
Outlet Elevation =	4891.46'	4893.8'
Length =	52.5 ft	37.5 ft
Manning's Roughness =	0.013	0.013
Elevation of top of Ditch at Inlet =	4892.7'	4895.46'
Calculated Capacity at top of Ditch HW Elevation =	5.37 cfs	8.38 cfs
Rip Rap Sizing =	Type M, 4' X 4'	Type M, 4' X 4'

Conclusion

The above parameters were entered into the UD-Channels Spreadsheets to determine the full flow capacity of the irrigation ditches. Please refer to Appendix C-13, the Normal Flow Analysis Trapezoidal Channel: Northeast Irrigation Ditch 1, and C-16, the Normal Flow Analysis Trapezoidal Channel: Northeast Irrigation Ditch 2, for details. These values for the required design capacity along with the above values for the culverts were entered into the UD-Culverts spreadsheet to determine the culverts flow capacity. Please refer to Appendix C-14 , the Culvert Stage-Discharge Sizing - Northeast Irrigation Ditch 1, and C-17, the Culvert Stage-Discharge Sizing - Northeast Irrigation Ditch 2, for details. Based on this analysis, the proposed culverts are sufficiently sized to convey the full flow of the irrigation ditches.

The culvert properties were then entered into the UD-Culvert Outlet protection spreadsheet to determine the required Rip Rap sizing. Since the required rip rap type was calculated to be Type VL, Type M will be proposed instead for safety considerations. Please refer to Appendix C-15 , Determination of Culvert Headwater and Outlet Protection - Northeast Irrigation Ditch 1, and C-18, Determination of Culvert Headwater and Outlet Protection - Northeast Irrigation Ditch 2, for details.

This analysis shows that the culverts, as designed, are sufficient to convey the full capacity of the irrigation ditches.

Width of Protection	**T =**	**2**	**ft**

MLVT Failure Analysis

The following is an analysis of the routing and flow rate of water in the event of a failure of an MLVT on the Bybee 14-L drill pad.

MLVT Properties:

Diameter: D= 157 ft
Capacity: Vol = 42,000 Barrels = 1,764,000 Gallons
= 235,813 cubic feet = 7.21 acre-ft

Size of Onsite and Surrounding Basin at time of MLVT use

Stage Elevation	Surface Area at Stage	Volume Below Stage	Volume Below Stage
ft	ft^2	ft^3	acre-ft
4888.5	6695		
4889.0	128224	33729.75	0.77
4889.3	189194	81342.45	1.87
4889.5	470245	147286.35	3.38
4889.7	496288	218438.85	5.01

The final elevation in the above table, 4889.7', represents the highest connected contour around the pad during the time in which the MLVTs will be on site. This indicates that the first 5.01 acre-ft released from the MLVTs will pond around the site. Once this elevation is reached, the remaining water released from the tanks would flow between the irrigation ditches at the Northwest corner of the field (this is the low point of the surrounding contours) and from there would flow towards the Godding Hollow Drainage Channel. Please see Drainage plan DP1 for this location.

In the event of MLVT failure, the assumption is shown as follows:

Assumption:

MLVT Drain Time: T= 10 min = 600 Sec

Discharge Calculation:

Q = Vol / T
= 235,813 ft^3 / 600 Sec
= 393.02 cfs

100 yr Flowrate of Godding Hollow = 9,730 cfs to 10,500 cfs*

The above calculations show that the flow rate from the MLVTs in the event of a failure would be approximately 1/25th of the 100 year storm flow rate in the Godding Hollow Channel.

*Taken from South Weld I-25 Corridor Master Drainage Plan Table 4.4 - Major Drainageway Peak Discharges for Existing Conditions. Values represent those for the nearest road crossings (WCR 20 and WCR 22 respectively)

DETENTION POND EMERGENCY SPILLWAY REF:

REFERENCE UDFCD VOL.2 STORAGE

Broad-Crested Weir: The equation typically used for a broad-crested weir is:

$$Q = C_{BCW} L H^{1.5} \qquad \text{(SO-18)}$$

in which:

Q = discharge (cfs)

C_{BCW} = broad-crested weir coefficient (This ranges from 2.38 to 3.32 as per Brater and King (1976). A value of 3.0 is often used in practice.)

L = broad-crested weir length (ft)

H = head above weir crest (ft)

V-Notch Weir: The discharge through a V-notch or triangular weir is shown in Figure SO-5 and can be calculated from the following equation:

$$Q = C_t \tan\left(\frac{\theta}{2}\right) H^{2.5} \qquad \text{(SO-20)}$$

in which:

C_t = Coefficient for Triangular Weir taken from the table below

Q = discharge (cfs)

θ = angle of V-notch in degrees

H = head above the apex of V-notch (ft)

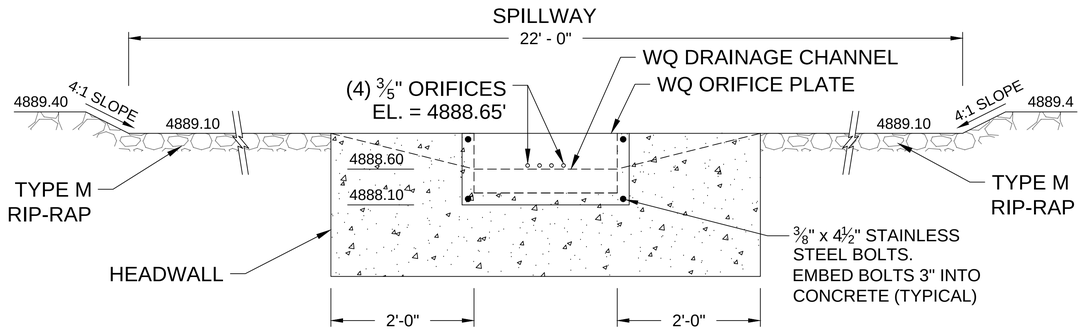
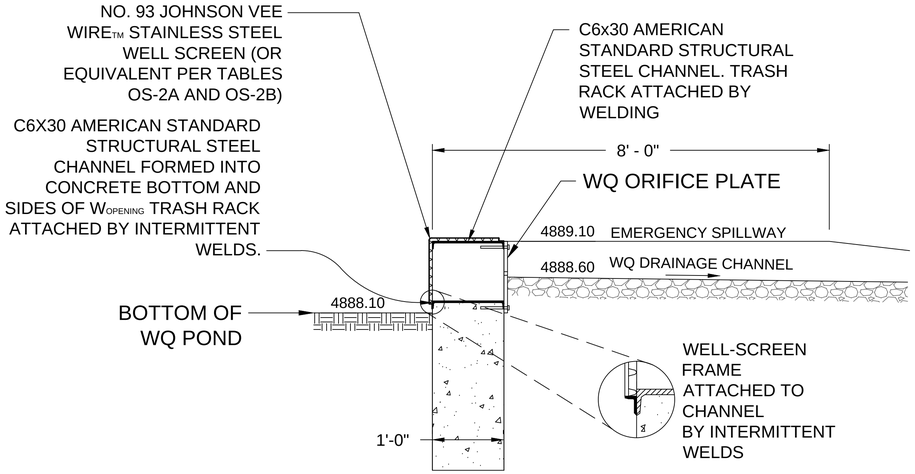
NOTE:
1. INFILTRATION BED TO BE LOCATED BENEATH ENTIRE WQ POND
2. AVOID VEHICLE TRAFFIC OVER INFILTRATION BED
3. USE LIGHTWEIGHT MACHINERY DURING CONSTRUCTION TO AVOID OVER-COMPACTION
4. INSPECT AND CLEAN INFILTRATION BED TWICE ANNUALLY

INFILTRATION BED DETAIL



CROSS SECTION A-A



CROSS SECTION B-B

NOTE:
1. OUTLET STRUCTURE TO BE CAST IN PLACE
2. SEE CDOT DETAIL M-601-1 FOR REINFORCEMENT

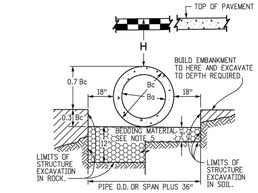
SKEW FACTOR TABLE

GENERAL NOTES

1. CONCRETE SHALL BE CLASS B.
2. HEADWALL SHALL BE PERPENDICULAR TO THE PIPE ℄ UNLESS OTHERWISE SHOWN ON THE PLANS. TABULATED DIMENSIONS AND QUANTITIES MUST BE ADJUSTED FOR SKEWED INSTALLATIONS.
3. FOR WINGWALL DETAILS, SEE STANDARD PLAN M-601-20.
4. VOLUME OCCUPIED BY PIPE HAS BEEN DEDUCTED FROM STEEL AND CONCRETE QUANTITIES.
5. EXPOSED CONCRETE CORNERS SHALL BE CHAMFERED ¾ IN.
6. ALL REINFORCING BARS SHALL HAVE A 2 IN. MINIMUM CLEARANCE.

▲ WHEN TWO OR MORE PIPES ARE LAID SIDE BY SIDE, THEY SHALL BE PLACED SO THAT THE ADJACENT PIPES WILL BE ½ INSIDE DIAMETER APART, OR ½ INSIDE SPAN APART, OR 3 FT. APART (INCLUDING WALL THICKNESS), WHICHEVER IS LESS.

■ ADD 0.89 x (X OR X_1) (LB.) WHEN APRON IS REQUIRED.



NOTE: Bc IS THE OUTSIDE DIMENSION FOR DIAMETER, SPAN OR RISE.

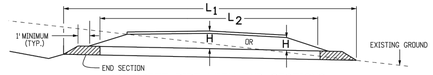
△ ALSO EQUIVALENT ROUND DIMENSION FOR ELLIPTICAL PIPE.

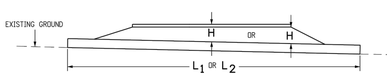
DIMENSIONS FOR REINFORCED CONCRETE PIPE
(FOR INFORMATION ONLY)



CONCRETE PIPE WITH END SECTIONS

NOTE: USE THE H THAT IS GREATER FOR MAXIMUM ALLOWABLE FILL HEIGHT.

H = HEIGHT OF FILL OVER TOP OF PIPE, INCLUDING PAVEMENT THICKNESS.
L_1 = LENGTH OF PIPE TO BE MEASURED WHEN PLACED IN ACCORDANCE WITH SECTION 624.
L_2 = LENGTH OF PIPE TO BE MEASURED WHEN PLACED IN ACCORDANCE WITH SECTION 603.



CONCRETE PIPE WITHOUT END SECTIONS

NOTE: USE THE H THAT IS GREATER FOR MAXIMUM ALLOWABLE FILL HEIGHT.

ALLOWABLE RANGE OF HEIGHTS FOR FILL
OVER REINFORCED CONCRETE PIPE
(ALL SIZES)

GENERAL NOTES

REINFORCED CONCRETE PIPE

1. FILL HEIGHTS GREATER THAN MAXIMUM ALLOWED IN THE HEIGHTS OF FILL TABLE ON THIS SHEET REQUIRE SPECIAL DESIGN OF STRUCTURE.
2. PIPE DESIGN IS BASED ON SAFETY FACTOR OF 1.33 ON ULTIMATE STRENGTH.
3. THE HEIGHTS OF FILL OVER TOP OF PIPE ARE BASED ON UNIT WEIGHT OF SOIL AT 135 LBS. PER CUBIC FT.
4. PIPE CLASS IS DETERMINED FROM 0.01 IN. CRACK D-LOAD.
5. BEDDING IS CLASS B (MODIFIED) (FROM CONCRETE PIPE DESIGN MANUAL-AMERICAN CONCRETE PIPE ASSOCIATION) WITH SETTLEMENT RATIO $R = 0.0_{SD}$ (YIELDING BED). BEDDING MATERIAL FOR RIGID PIPE IN SOIL SHALL BE 3 IN. LOOSE THICKNESS STRUCTURE BACKFILL CLASS 2. BEDDING MATERIAL FOR RIGID PIPE IN ROCK SHALL BE 12 IN. LOOSE THICKNESS STRUCTURE BACKFILL CLASS 1.
6. CHANGES IN DESIGN FACTORS REQUIRE COMPENSATING CHANGES IN PIPE DESIGN.
7. MINIMUM WALL THICKNESS DIMENSIONS ARE BASED ON AASHTO M 170 (WALL B) FOR CIRCULAR PIPE, AND AASHTO M 207 FOR ELLIPTICAL PIPE.
8. SPACING FOR MULTIPLE PIPE INSTALLATIONS SHALL CONFORM TO THE DETAILS SHOWN ON STANDARD PLAN M-206-1.
9. WHEN A PIPE IS TO BE EXTENDED, THE SAME PIPE MATERIAL AND SIZE AS IN THE ORIGINAL PIPE INSTALLATION SHALL BE USED.

NONREINFORCED CONCRETE PIPE

1. AT THE OPTION OF THE CONTRACTOR, NONREINFORCED CONCRETE PIPE CONFORMING TO AASHTO M 86 MAY BE USED IN LIEU OF REINFORCED CONCRETE PIPE FOR ALL SIZES 36 INCHES IN DIAMETER AND SMALLER. THE NONREINFORCED CONCRETE PIPE SHALL MEET THE SAME D-LOAD TO PRODUCE THE ULTIMATE LOAD UNDER THE THREE-EDGE BEARING METHOD AS SPECIFIED FOR REINFORCED CONCRETE PIPE IN CONFORMANCE WITH AASHTO M 170. THE CONTRACTOR SHALL PROVIDE WRITTEN CERTIFICATION OF CONFORMANCE. THE WALL THICKNESS OF THE NONREINFORCED PIPE MAY BE INCREASED AS REQUIRED TO MEET D-LOAD REQUIREMENT.
2. ALL REQUIREMENTS FOR REINFORCED CONCRETE PIPE, EXCEPT THOSE REFERRING TO REINFORCEMENT, SHALL APPLY TO NONREINFORCED CONCRETE PIPE.
