Rob

Attached is a Form 27 that provides the procedures for additional remediation and conversion of the skim pit excavation at the Lipplemann "P" lease to produced water storage. The three wells will be shut in right away to begin draining the water from the open skim pit excavation and adjacent evaporation pit so that impacted soil associated with the collapse of the shared wall between the two pits can be excavated.

Please let me know if additional information is needed.

Thanks

Dave

Dave,

I will upload this unapproved Form 27 to the project file as an update to Rem #9058. If I process the Form 27 it will generate a new remediation project number. The east wall and as much eroded material as can be recovered should be removed. A minimum of two base samples and three sidewall samples should be collected and analyzed for BTEX and TPH to confirm impacted material removal.

Please send photos of the collapsed wall/ post collapse condition if you have them.

Thank you,

Robert J. Young
