

Photo 1. View of the western portion of the project area from the southwestern corner facing northward. Revegetation is largely comprised of smooth brome (*Bromus inermis*) and weeds such as yellow tumble mustard (*Sysimbrium altissimum*).

Photo 2. View of Canada thistle from the previous season. Canada thistle should be treated at the appropriate time in 2016 but no later than seedhead maturity.

Photo 3. View of the eastern portion of the project area from the southeastern corner facing northward. The eastern edge was recently hydromulched and appears to be stabilized at this time.

Photo 4. View of the northern portion of the project area from the northeastern corner facing westward.
