Soil/Geology Description:

The site bedrock geology consists of the Tertiary White River Group, including the Slim Buttes Formation, Chamberlain Pass Formation, and Chadron Formation of the Eocene age and the Brule Formation of the Oligocene age. The White River Group consists of white, pink, light-green, and light-brown to maroon bentonite, claystone, siltstone, tuffaceous fine-grained sandstone, and local silicified carbonate lenses. The basal portion consists of poorly cemented, white, coarse-grained arkose and conglomerate. The Chamberlain Pass Formation consists of pale olive to pale red mottled mudstone containing white, cross-bedded channel sandstone with basal conglomerate.

Additional Spill Details Not Provided Above:

All four "water wells" indicated above are permitted groundwater monitoring wells that were installed by a consultant for Whiting to monitor this site. The wells were completed to 40 feet bgs and have static water levels reported at 38 feet bgs. Impacted soils were excavated and stockpiled on site awaiting transportation to Ault landfill for disposal. Closure confirmation samples were collected from excavated area and submitted for analysis.

REQUEST FOR CLOSURE
