Mr. Fritzler,

The above referenced Form 27 has been approved with the following conditions:

1. Trench through the former skim pit in order to evaluate the extent of potential petroleum hydrocarbon impacts and to guide the selection of soil sampling locations. Two intersecting trenches one oriented N-S and one E-W should be installed across the bottom of the former skim pit and up the sidewalls to fully expose representative cross sections.
2. Fully excavate the impacted soils from the base and sidewalls of the former oil skim pit prior to collecting confirmation samples for laboratory analysis of BTEX and TPH. Soil within 3 feet of the planned final surface elevation should meet Table 910-1 allowable levels for pH, EC and SAR.
3. The cement cistern shall be hydrostatically tested after modification in order to confirm integrity.
4. The anticipated completion date reported in the implementation schedule is August 2018. This remediation project shall be completed, including backfilling and re-seeding, by October 31, 2017.
5. Upon completion, provide the COGCC a brief report of the remediation project with a request for closure of Pit Facility ID #109584. Include a location drawing showing the excavation outline and soil sample locations and depths, a soil sample data summary table, soil disposal manifests, hydrostatic test data and photographs of the excavation.

Please reference Rem#10008 on all future correspondence related to this project.

Thank you,

Robert J. Young
