COMMENTS:

Add two (2) manifold skids to the location. Therefore, the new total is two (2) manifold skids.

Buried flowlines are utilized to transfer multiphase flow from the wellheads to the production facility. A three (3) inch nominal diameter steel flowline engineered to handle design pressures connect each wellhead to a manifold skid. The flowlines continue from the manifold skids to the production facility off of the pad. During production, the flow is from the wellhead at the production facility. Individual flowlines that connect the wellheads to the manifold buildings are approximately 300 feet in length. The flowline sections that originate at the manifold skids and terminate at the production facility are approximately 1250 feet in length.

The modification of this existing oil & gas location was within the originally disturbed area, and there was not additional surface disturbance. In addition, the modification did not change the cultural distances included on the original Form 2A.
