**General Comment:**

**Environmental****Spills/Releases:**Type of Spill: CONDENSATEEstimated Spill Volume: 84

Comment: Followup to Spill#451576. 84 bbl release from tank via subsurface drain line to closed pit. Weather is 90 F and clear. No indications of release on surface. No seeps or odor in dry gulch to the North or at surface of former pit. Trackhoe staged on location but no personnel or activity on site. Per spill report "spill is now contained within the pre-existing pit. A roustabout company was notified to replace the non-freeze valve ASAP and will plug off and disconnect the line running to the closed pit. A plan will be submitted within the next couple days to specify the steps involved to remediate the spill"

Corrective Action: Per COA "Assess nature and extent of soil and/or groundwater contamination with confirmation samples. Documentation must include a figure showing spill area with sample locations plus laboratory results. Assess and remediate to Table 910-1 standards and provide documentation in a either a Supplemental F-19 or F-27. A Form-27 Assessment and Remediation Plan is required if extended remediation is planned. Any onsite remediation such as landfarming must also be approved by surface owner (BLM). Any planned remediation other than an immediate "dig and haul" of contaminated soil to an offsite licensed disposal facility must be preapproved by COGCC. Documentation must include a figure showing spill area with sample locations plus laboratory results."
