Lead-210 Case Narrative

COGCC PW NORM 2017 – 10048

Work Order Number: 1706286

1. This report consists of analytical results and supporting documentation for two water samples received by ALS on 06/13/2017.
2. These samples were analyzed for the presence of ^{210}Pb according to the current revision of SOP 704. The analyses were completed on 07/07/2017.
3. Sample volume was insufficient to allow preparation of a duplicate. A laboratory control sample duplicate (LCSD) was prepared in lieu of a client sample duplicate.
4. The analysis results for these samples are reported in units of pCi/L. The samples were filtered prior to analysis.
5. In the analysis of the raw data, "Window 2" is monitored for high-energy beta contamination. Samples 1706286-3 and PB170704-1MB had "Window 2" count rates slightly above the upper control limit of 0.837 cpm, established from calibration on 07/05/2017 through 07/07/2017, at 0.86 cpm and 0.85 cpm, respectively. The samples had observed activity at a level below the achieved MDC. Thus, the data quality is believed to be unaffected and the results are submitted without further qualification.
6. The requested detection limit was not met for samples 1706286-1 and -3. To prevent matrix interference, these samples were prepared at a reduced aliquot. The results for these samples are identified with an 'M' qualifier on the final reports. The results are submitted without further qualification.
7. No further anomalous situations were encountered during the preparation or analysis of these samples. All remaining quality control criteria were met.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

CONDITION OF SAMPLE UPON RECEIPT FORM

Client: COC

Workorder No: 1706286

Project Manager: SS

Initials: JNS Date: 6/13/17

1. Does this project require any special handling in addition to standard ALS procedures?	YES	NO	
2. Are custody seals on shipping containers intact?	NONE	YES	NO
3. Are Custody seals on sample containers intact?	NONE	YES	NO
4. Is there a COC (Chain-of-Custody) present or other representative documents?	YES	NO	
5. Are the COC and bottle labels complete and legible?	YES	NO	
6. Is the COC in agreement with samples received? (IDs, dates, times, no. of samples, no. of containers, matrix, requested analyses, etc.)	YES	NO	
7. Were airbills / shipping documents present and/or removable?	DROP OFF	YES	NO
8. Are all aqueous samples requiring preservation preserved correctly? (excluding volatiles)	N/A	YES	NO
9. Are all aqueous non-preserved samples pH 4-9?	N/A	YES	NO
10. Is there sufficient sample for the requested analyses?	YES	NO	
11. Were all samples placed in the proper containers for the requested analyses?	YES	NO	
12. Are all samples within holding times for the requested analyses?	YES	NO	
13. Were all sample containers received intact? (not broken or leaking, etc.)	YES	NO	
14. Are all samples requiring no headspace (VOC, GRO, RSK/MEE, Rx CN/S, radon) headspace free? Size of bubble: _____ < green pea _____ > green pea	N/A	YES	NO
15. Do any water samples contain sediment? Amount of sediment: _____ dusting <input checked="" type="checkbox"/> moderate _____ heavy	Amount N/A	YES	NO
16. Were the samples shipped on ice?	YES	NO	
17. Were cooler temperatures measured at 0.1-6.0°C? Cooler #: <u>1</u> <u>2</u> <u>3</u> <u>4</u> Temperature (°C): <u>46</u> <u>46</u> <u>4</u> <u>3.6</u> No. of custody seals on cooler: <u>0</u> <u>0</u> <u>0</u> <u>0</u>	IR gun used*: #2 <u>#4</u> RAD ONLY External µR/hr reading: <u>1.0</u> Background µR/hr reading: <u>10</u>	YES	NO

Comments:

Data Package ID: PB1706286-1

Qualifiers/Flags:

U - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

D - DER is greater than Control Limit of 2.13

+ - Duplicate RPD not within limits.

LT - Result is less than Request MDC, greater than sample specific MDC

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'

- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'

Notes:

1) The Tracer results are not yield corrected (i.e. activity measured not activity added).

2) Where sample time is not available, 12:00 PM (Mountain) is used for decay correction.

Abbreviations:

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

BDL - Below Detection Limit

Date Printed: Monday, July 17, 2017

ALS -- Fort Collins

LIMS Version: 6.843

Lumex LCL = 0.00
Lumex UCL = 10.00

The gross count rates and count times used for the final activity calculations and the lumex correction sheet are different than the values shown on the raw data output. These values come from two software programs which round the sample counts differently. The difference between these two values is believed to be insignificant. Window 2 control limits are established using the average count rate from the three reagent blanks +/- 3X the estimated Poisson uncertainty.

CERTIFICATE OF CALIBRATION
Standard Radionuclide Source

80328-307

Pb-210 5 mL Liquid in Flame Sealed Vial

Customer: ALS Laboratory Group / Fort Collins
P.O. No.: 73625 07-24-09, Item 1

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated by liquid scintillation counting. Radionuclide purity and calibration were checked by germanium gamma-ray spectrometry and liquid scintillation counting. The nuclear decay rate and assay date for this source are given below. Eckert & Ziegler Analytics (EZA) maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST." EZA is accredited by the Health Physics Society (HPS) for the production of NIST-traceable sources, and this source was produced in accordance with the HPS accreditation requirements. Customers may report any concerns with the accreditation program to the HPS Secretariat, 1313 Dolley Madison Blvd., Ste. 402, McLean, VA 22101.

Isotope	Half-Life, Days	Activity (Bq)	Uncertainty*, %			Reference Date (12:00 PM EST)
			Type u_A	Type u_B	Type U	
Pb-210	8145.1	4.078E+04	0.1	1.4	2.8	08/10/2009

*Uncertainty: U - Relative expanded uncertainty, $k = 2$. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

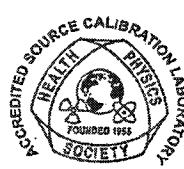

Comments:

Impurities: gamma-impurities <0.1%, alpha-impurities (other than decay products) <0.01%. 52.06357 grams 1M HNO₃ solution, carrier free.

Q1220 Pb-210 Background Determination

Interim control limits are established from the initial calibration for the analysis and geometry of interest QR from the initial batch calibration blank data set acquired after the instrument re-calibration. Limits are +/- 3 standard deviations (counting unc.) from the initial calibration blank data. Once enough historical data is acquired, new historical limits are set as follows: Control limits for reagent blanks are established from 30 individual historical data points (10 batches). Limits are +/- 3 standard deviations from 30 individual historical data points. Individual reagent blanks and the average of reagent blanks from each batch are in control if the Count Rate (CPM) is within the established control limits.

CURRENTLY UNDER HISTORICAL LIMITS

COUNT DATE	#	Sample ID	Updated on 05/30/13 NES				Individual Reagent Blanks				Average of Reagent Blanks		
			Count (m)	Duration (m)	Count (CPM)	Total Cts.	Mean	LCL	UCL	Pass ?	LCL	UCL	Pass ?

Lumex LCL = 0.00
Lumex UCL = 10.00

Counts differently. The difference between these two values is believed to be insignificant. Window 2 control limits are established using the average count rate from the three reagent blanks +/- 3X the estimated Poisson uncertainty.

Comments

Pb21-single point calibration. Samples spiked (calibration spike) into 5ml 8N HNO3. A 0.05mL initial ICP was taken and samples loaded onto Sr spec column to remove Bi-210.

Q1220 Pb-210 Background Determination

Interim control limits are established from the initial calibration for the analysis and geometry of interest OR from the initial batch calibration blank data set acquired after the instrument re-calibration. Limits are +/- 3 standard deviations (counting unc.) from the initial calibration blank data. Once enough historical data is acquired, new historical limits are set as follows: Control limits for reagent blanks are established from 30 individual historical data points (10 batches). Limits are +/- 3 standard deviations from 30 individual historical data points. Individual reagent blanks and the average of reagent blanks from each batch are in control if the Count Rate (CPM) is within the established control limits.

CURRENTLY UNDER HISTORICAL LIMITS

Updated on 05/30/13 NES							Individual Reagent Blanks					Average of Reagent Blanks

Standard Reference Material 4337 Lead-210 Radioactivity Standard

This Standard Reference Material (SRM) consists of a solution of a standardized and certified quantity of radioactive lead-210 in a suitably stable and homogeneous matrix. It is intended primarily for the calibration of instruments that are used to measure radioactivity and for the monitoring of radiochemical procedures. The solution, whose composition is specified in Table 1, is contained in a flame-sealed, 5 mL, NIST, borosilicate-glass ampoule (see Note 1)*.

The certified lead-210 massic activity value, at a Reference Time of 1200 EST, 15 June 2006, is:

$$(9.037 \pm 0.22) \text{ kBq g}^{-1}$$

Additional physical, chemical, and radiological properties for the SRM, as well as details on the standardization method, are given in Table 1. Uncertainty intervals for certified quantities are expanded ($k=2$) uncertainties calculated according to the ISO and NIST Guidelines (see Note 2). Table 2 contains a specification of the components that comprise the uncertainty analyses.

The certification of this SRM, within the measurement uncertainties specified, is valid for at least five (5) years after receipt. The solution matrix, in an unopened ampoule, is believed to be indefinitely homogeneous and stable, within its half-life-dependent, useful lifetime. NIST will monitor this material and will report any substantive changes in certification to the purchaser. Should any of the certified values change, purchasers of this SRM will be notified of the change by NIST.

This SRM may represent a radiological hazard and a chemical hazard. Consult the Material Safety Data Sheet (MSDS), enclosed with the SRM shipment, for details (see Note 1).

This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, Dr. M.P. Unterweger, Acting Group Leader. The overall technical direction and physical measurements leading to certification were provided by Drs. R. Colle, and L. Laureano-Pérez of the Radioactivity Group with production assistance by D.B. Golas and C. Palabrida, Research Associates of the Nuclear Energy Institute and with measurement assistance by Drs. I.Outola, L. Pihida and R. Fitzgerald of the Radioactivity Group. The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program.

Reference time	1200 EST, 15 June 2006
Massic activity of the solution	9.037 kBq·g ⁻¹
Relative expanded uncertainty ($k = 2$)	2.4 % (see Note 2)*

Uncertified information

Source description	Liquid in flame-sealed, 5 mL NIST borosilicate ampoule (see Note 1)
Solution composition	$1.0 \text{ mol}\cdot\text{L}^{-1} \text{ HNO}_3$ with $21 \mu\text{g Bi}^{+3}$ and $11 \mu\text{g Pb}^{+2}$ per gram of solution
Solution density	$(1.028 \pm 0.002) \text{ g}\cdot\text{mL}^{-1}$ at 20.0°C (see Note 3)
Solution mass	$(5.133 \pm 0.002) \text{ g}$ (see Note 3)
Photon-emitting impurities	None detected (see Note 4)
Half-lives used	^{210}Pb : $(22.20 \pm 0.22) \text{ a}^{\dagger}$ ^3H : $(12.32 \pm 0.02) \text{ a}^{\dagger}$
Nuclear data used in CN2003 computations (beta-particle maximum energies; branching ratios; transitions) [1]	^3H : $(18.394 \pm 0.008) \text{ keV}^{\ddagger}$; 1; allowed ^{210}Pb : $(63.5 \pm 0.5) \text{ keV}^{\ddagger}$; (0.16 ± 0.03) ; non-unique first forbidden $(17.0 \pm 0.5) \text{ keV}^{\ddagger}$; (0.84 ± 0.03) ; non-unique first forbidden ^{210}Bi : $(1162.1 \pm 1.5) \text{ keV}^{\ddagger}$; 1; non-unique first forbidden
Calibration method (and instruments)	The certified massic activity for ^{210}Pb in radioactive equilibrium with ^{210}Bi and ^{210}Po was obtained by $4\pi\alpha\beta$ liquid scintillation (LS) spectrometry with three commercial LS counters. The LS detection efficiency was calculated using the CN2003 code [2] for the CIEMAT/NIST method with composition matched LS cocktails of a ^3H standard as the efficiency detection monitor. Confirmatory measurements were also performed by high-resolution HPGe gamma-ray spectrometry, by $2\pi\alpha$ spectrometry of separated ^{210}Po with a Si surface barrier detector, and by $4\pi\beta(\text{LS}) - \gamma(\text{NaI})$ anticoincidence counting.

[†] See Note 5

NOTES

Note 1. Refer to <http://physics.nist.gov/Divisions/Div846/srm.html> for the standardized ampoule dimensions and for assistance and instructions on how to properly open an ampoule. Information on additional storage and handling requirements is also included in the website.

Note 2. The uncertainties on certified values are expanded uncertainties, $U = k u_c$. The quantity u_c is the combined standard uncertainty calculated according to the ISO and NIST Guides (see references [3] and [4]). The combined standard uncertainty is multiplied by a coverage factor of $k = 2$ and was chosen to obtain an approximate 95 % level of confidence.

Note 3. The stated uncertainty is two times the standard uncertainty. See reference [4].

Note 4. The estimated lower limits of detection for photon-emitting impurities, expressed as massic photon emission rates, on 27 December 2005, were:

$$\begin{aligned} & 1.7 \text{ s}^{-1} \text{ g}^{-1} \text{ for } 20 \text{ keV} < E < 60 \text{ keV} \\ & 0.3 \cdot 10^{-1} \text{ g}^{-1} \text{ for } 60 \text{ keV} < E < 1800 \text{ keV} \end{aligned}$$

Note 5. The stated uncertainty is the standard uncertainty. See reference [4].

CERTIFICATE OF CALIBRATION
Standard Radionuclide Source

80328-307
Pb-210 5 mL Liquid in Flame Sealed Vial

Customer: ALS Laboratory Group / Fort Collins
P.O. No.: 73625 07-24-09, Item 1

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated by liquid scintillation counting. Radionuclide purity and calibration were checked by germanium gamma-ray spectrometry and liquid scintillation counting. The nuclear decay rate and assay date for this source are given below. Eckert & Ziegler Analytics (EZA) maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST." EZA is accredited by the Health Physics Society (HPS) for the production of NIST-traceable sources, and this source was produced in accordance with the HPS accreditation requirements. Customers may report any concerns with the accreditation program to the HPS Secretariat, 1313 Dolley Madison Blvd., Ste. 402, McLean, VA 22101.

Standard Reference Material 4337 Lead-210 Radioactivity Standard

This Standard Reference Material (SRM) consists of a solution of a standardized and certified quantity of radioactive lead-210 in a suitably stable and homogeneous matrix. It is intended primarily for the calibration of instruments that are used to measure radioactivity and for the monitoring of radiochemical procedures. The solution, whose composition is specified in Table 1, is contained in a flame-sealed, 5 mL, NIST, borosilicate-glass ampoule (see Note 1)*.

The certified lead-210 massic activity value, at a Reference Time of 1200 EST, 15 June 2006, is:

$$(9.037 \pm 0.22) \text{ kBq} \cdot \text{g}^{-1}$$

Additional physical, chemical, and radiological properties for the SRM, as well as details on the standardization method, are given in Table 1. Uncertainty intervals for certified quantities are expanded ($k=2$) uncertainties calculated according to the ISO and NIST Guidelines (see Note 2). Table 2 contains a specification of the components that comprise the uncertainty analyses.

The certification of this SRM, within the measurement uncertainties specified, is valid for at least five (5) years after receipt. The solution matrix, in an unopened ampoule, is believed to be indefinitely homogeneous and stable, within its half-life-dependent, useful lifetime. NIST will monitor this material and will report any substantive changes in certification to the purchaser. Should any of the certified values change, purchasers of this SRM will be notified of the change by NIST.

This SRM may represent a radiological hazard and a chemical hazard. Consult the Material Safety Data Sheet (MSDS), enclosed with the SRM shipment, for details (see Note 1).

This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, Dr. M.P. Unterweger, Acting Group Leader. The overall technical direction and physical measurements leading to certification were provided by Drs. R. Collé, and L. Laureano-Pérez of the Radioactivity Group with production assistance by D.B. Golas and O. Palabrida, Research Associates of the Nuclear Energy Institute and with measurement assistance by Drs. I. Outola, L. Pibida and R. Fitzgerald of the Radioactivity Group. The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program.

12	Beta decay branching ratios for ^{210}Pb for an uncertainty of 0.03	B	0.39
13	$E_{\beta(\max)}$ for ^{210}Bi for an uncertainty of 1.5 keV	B	0.001
14	Computed β detection efficiency for ^{210}Pb	B	1.1
15	Computed β detection efficiency for ^{210}Bi	B	0.04
16	Assumed α detection efficiency for ^{210}Po , including extrapolation to zero energy	B	0.05
Relative combined standard uncertainty			1.2
Relative expanded uncertainty ($k = 2$)			2.4

[†] = (A) denotes evaluation by statistical methods; (B) denotes evaluation by other methods.

Table 1. Properties of SRM 4337

Certified values	
Radionuclide	Lead-210
Reference time	1200 EST, 15 June 2006
Massic activity of the solution	$9.037 \text{ kBq}\cdot\text{g}^{-1}$
Relative expanded uncertainty ($k = 2$)	2.4 % (see Note 2)*

Uncertified information	
Source description	Liquid in flame-sealed, 5 mL NIST borosilicate ampoule (see Note 1)
Solution composition	$1.0 \text{ mol}\cdot\text{L}^{-1} \text{ HNO}_3$ with $21 \mu\text{g Bi}^{+3}$ and $11 \mu\text{g Pb}^{+2}$ per gram of solution
Solution density	$(1.028 \pm 0.002) \text{ g}\cdot\text{mL}^{-1}$ at 20.0°C (see Note 3)
Solution mass	$(5.133 \pm 0.002) \text{ g}$ (see Note 3)
Photon-emitting impurities	None detected (see Note 4)
Half-lives used	$^{210}\text{Pb} : (22.20 \pm 0.22) \text{ a}^{\dagger}$ $^3\text{H} : (12.32 \pm 0.02) \text{ a}^{\dagger}$
Nuclear data used in CN2003 computations (beta-particle maximum energies; branching ratios; transitions) [1]	$^3\text{H} : (18.394 \pm 0.008) \text{ keV}^{\ddagger}$; 1; allowed $^{210}\text{Pb} : (63.5 \pm 0.5) \text{ keV}^{\ddagger}$; (0.16 ± 0.03) ; non-unique first forbidden $(17.0 \pm 0.5) \text{ keV}^{\ddagger}$; (0.84 ± 0.03) ; non-unique first forbidden $^{210}\text{Bi} : (1162.1 \pm 1.5) \text{ keV}^{\ddagger}$; 1; non-unique first forbidden
Calibration method (and instruments)	The certified massic activity for ^{210}Pb in radioactive equilibrium with ^{210}Bi and ^{210}Po was obtained by $4\pi\alpha\beta$ liquid scintillation (LS) spectrometry with three commercial LS counters. The LS detection efficiency was calculated using the CN2003 code [2] for the Ciemat/NIST method with composition matched LS cocktails of a ^3H standard as the efficiency detection monitor. Confirmatory measurements were also performed by high-resolution HPGe gamma-ray spectrometry, by $2\pi\alpha$ spectrometry of separated ^{210}Po with a Si surface barrier detector, and by $4\pi\beta(\text{LS}) - \gamma(\text{NaI})$ anticoincidence counting.

[†] See Note 5

NOTES

Note 1. Refer to <http://physics.nist.gov/Divisions/Div846/strm.html> for the standardized ampoule dimensions and for assistance and instructions on how to properly open an ampoule. Information on additional storage and handling requirements is also included in the website.

Note 2. The uncertainties on certified values are expanded uncertainties, $U = k u_c$. The quantity u_c is the combined standard uncertainty calculated according to the ISO and NIST Guides (see references [3] and [4]). The combined standard uncertainty is multiplied by a coverage factor of $k = 2$ and was chosen to obtain an approximate 95 % level of confidence.

Note 3. The stated uncertainty is two times the standard uncertainty. See reference [4].

Note 4. The estimated lower limits of detection for photon-emitting impurities, expressed as massic photon emission rates, on 27 December 2005, were:

$$\begin{aligned} & 1.7 \text{ s}^{-1} \text{ g}^{-1} \text{ for } 20 \text{ keV} < E < 60 \text{ keV} \\ & 0.3 \text{ s}^{-1} \text{ g}^{-1} \text{ for } 60 \text{ keV} < E < 1800 \text{ keV.} \end{aligned}$$

Note 5. The stated uncertainty is the standard uncertainty. See reference [4].
