Re: 2nd Quarter 2008 Groundwater Monitoring Report
McClellan 3-1, 3-32, and 3-35 Tank Battery
NWSW Section 3, Twn 4N, Range 65W
API # 05-123-11347 (for 3-1)
Weld County, Colorado

Dear Mr. Ferguson;

On behalf of Petro-Canada Resources (USA) Inc. (Petro-Canada), Western Clean Up Corporation (Western) is pleased to present this groundwater monitoring report. A Form 19 "Spill Report" was completed by Petro Canada and submitted to the Colorado Oil and Gas Conservation Commission (COGCC). This report provides a brief site history and a summary of excavation clean up activities, groundwater monitoring data and conclusions.

Background

Reportedly, on October 31, 2007 an approximate four (4) barrel release of condensate occurred due to transport driver error during loading operations from the crude oil condensate tank to the transport truck impacting soil and shallow groundwater. On November 1, 2007 approximately 100 cubic yards of petroleum-impacted soil was excavated and transported to Petro-Canada's landfarm in Weld County. Free petroleum product was not observed in the excavation during excavation activities. Soil samples were collected during excavation activities to define the extent of impacted soil. All soil samples were analyzed with a photo-ionization detector (PID) calibrated to an isobutylene standard of 100 ppm to determine petroleum-impacted soils requiring excavation. Soil samples were placed in the ziplock baggies, and then placed in the sun for a period of ten to fifteen minutes to allow the volatile organic petroleum vapors to equilibrate inside the baggie. The tip of the PID was then inserted into the baggie, and then the maximum PID measurement was recorded.

Five (5) confirmation soil samples were collected around the perimeter of the excavation. The soil samples were transported by standard chain-of-custody (COC) procedures to Evergreen Analytical Laboratory in Wheat Ridge, Colorado. The soil samples were analyzed for total recoverable petroleum hydrocarbons (TRPH) using EPA method 418.1. Soil sample results document that TRPH concentrations were below COGCC's clean up levels for a sensitive area (1,000 mg/Kg) at the perimeter and depth of the excavation. TRPH concentrations ranged from 7.0 to 39.8 mg/Kg.

The excavation remained open from November 1 to 14, 2007 to facilitate the removal of impacted groundwater via vacuum trucks. Evacuation activities were conducted on November 3, 4, 5, and 7, 2007. A total of approximately 100 bbls of impacted groundwater (25 bbls per event) were evacuated and disposed of the fluids into a Class V re-injection well operated by Conquest Disposal located at 22625 County Road 64 in Weld County. During clean up activities groundwater samples were collected from the excavation. Groundwater samples were submitted to EAL for submitted for laboratory analysis for benzene, toluene, ethylbenzene and xylene (BTEX) using EPA method 8021. Benzene and toluene in groundwater exceeded GOGCC's limit on November 1 and 4, 2007. Benzene and toluene concentrations in the excavated pit diminished due to remedial activities. On November 5 and 6, 2007, toluene concentrations were documented at 390 and 370 micrograms per liter ($\mu\text{g/l}$) which are below COGCC's limit, and benzene concentrations were documented at of 46 $\mu\text{g/l}$ and 44 $\mu\text{g/l}$, respectively, which exceed COGCC's standard of 5 $\mu\text{g/L}$. Groundwater concentrations in the excavated pit are summarized in Table 2 in Attachment B.

Monitoring Well Installation

On November 9, 2007 Western mobilized to the site and installed five (5) 2-inch diameter monitoring wells (MW-1 through MW-5). The wells were completed with 10-slot screen set approximately 1-foot above the water table. Bentonite pellets with used for the seal for the surface completion for monitoring wells MW-1, MW-4, and MW-5, and a cement grout mixture for monitoring wells MW-2 and MW-3. The monitoring wells were developed on November 9, 2007.

Groundwater Sampling

Groundwater sampling collection was conducted on May 5, 2008. A clean, disposable bailer was used to sample each monitoring well and recovery well. Groundwater samples were collected in the appropriate sampling containers (40 ml VOA/VOC vials) and all samples were immediately labeled and stored in an iced cooler. Preservatives were used in all water samples to reduce degradation effects, and it was insured that bubbles or headspace were not present in the sample bottles. The samples were transported in an iced cooler under standard COC procedures to Origins Laboratory in Denver, Colorado and were received within QA/QC parameters. Groundwater samples were submitted for laboratory analysis for BTEX using EPA method 8260B.

HYDROGEOLOGY

The wells have not been surveyed. Groundwater is approximately 3 ft below ground surface and is estimated to flow in an easterly direction toward the Lower Latham Reservoir. Groundwater elevations are summarized in Table 2 in Attachment B.

FREE PHASE PRODUCT

Liquid phase hydrocarbons were not detected during the monitoring event.

MONITORING WELL GROUNDWATER ANALYTICAL RESULTS

BTEX was not observed above laboratory detection limits in the groundwater samples collected from monitoring wells MW-1 through MW-5 on May 5, 2008. Figure 1 in Attachment A presents a groundwater analytical data map and Table 2 in Attachment B presents groundwater analytical data. Attachment C contains a copy of the laboratory analytical report.

Mc Clellan Tank Battery Spill Clean Up
Weld County, Colorado

CONCLUSIONS

The groundwater analytical data indicates that the site remedial efforts have been successful, and that groundwater standards were not exceeded for BTEX in the May 5, 2008 sampling event.

Should you have any questions about the changes or require any additional information, please feel free to contact me at (303) 562-6854.

Sincerely,

Nick Fischer
Project/Chemical Engineer
