Good morning Andrew, and happy new year! Thanks for touching base regarding the 1041-2 well reclamation. I appreciated your crews diligence in removing the pit and liner and starting the reclamation. I went by to look at it in December and I think everything is proceeding well - the contour looks good and it was seeded and fenced. Now it's just a matter of time to let the vegetation grow in, and do weed control if weeds start coming in. Hopefully we can get some snow - it's been an unusually dry winter here so far.

Thank you for checking in, and I hope you're doing well up north.
Cheers,
Tracy

Good Afternoon,

I just wanted to recap the progress Samson Resources made on the GOVT 1042 well that we reclaimed earlier this year.

Initially we found there was contaminated soil on the site that was placed on a pit liner. The soil and pit liner was hauled to the Wray Gulch landfill at the end of the summer. We then recontoured the location, then seeded and fenced the location off to help in revegetation.

I wanted to make sure you were satisfied with the work that has been completed.

Thank you for all of the help along the way,

Andrew Winney, CSP
