Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

The release is believed to have occurred due to mechanical equipment failure on a completions tank from a hole on the bottom. The tank is currently being cleaned and inspected to verify the release was in fact cause by mechanical failure. Additional information as to the root cause of the release will be provided in the Supplemental Form 19 due within 10 day. Once on-site personnel observed liquids within the secondary containment, a vac truck was utilized to recover ~8 bbls in the northwest corner of the pad. The entire release has been contained on location within the earthen bermed containment cell and above the bentonite liner installed under the subsurface of the pad. No signs or indications of the release migrating laterally or vertically beyond the containment has been observed. Sample(s) have been collected from the areas that are accessible and will be submitted to the lab for Table 910-1 analysis.
