Subject: **Second Quarter 2018 Site Monitoring and Remediation Report**  
Plugged and Abandoned FRI 2-18 Tank Battery and Wellhead Location  
API # 05-001-08259  
Remediation Project # 8440  
Adams County, Colorado

Dear Mr. Evans:

Please find the enclosed copy of the above-referenced Second Quarter 2018 Site Monitoring and Remediation Report for the Plugged and Abandoned FRI 2-18 Tank Battery and Wellhead Location in Adams County, Colorado. The enclosed report describes groundwater sampling and remediation system operation and maintenance (O&M) activities conducted during the first quarter 2018, in accordance with the previously submitted Form 27 (COGCC document # 2148980). Please contact me at (720) 431-1190 if you require additional information.

Tasman appreciates the opportunity to provide this service.

Sincerely,  
Tasman Geosciences, Inc.

A handwritten signature in blue ink that reads "Brandon Bruns".

## **1.0 INTRODUCTION**

This Site Monitoring and Remediation Report (Report) presents the results of groundwater sampling and light non-aqueous phase liquid (LNAPL) recovery activities performed at the Plugged and Abandoned FRI 2-18 Tank Battery and Wellhead Location (Site). Field activities detailed in this report were performed on behalf of Noble Energy, Inc. (Noble), pursuant to Colorado Oil and Gas Conservation Commission (COGCC) guidance.

Field activities described in this Report were conducted by Tasman Geosciences, Inc. (Tasman) to further evaluate groundwater flow characteristics and groundwater quality at the Site. The data collected were used to maintain and optimize remediation system operations, develop the analytical summary tables, groundwater and LNAPL elevation maps, and chemical concentration maps presented herein.

### **1.1 Site Background**

The Site is located in Section 18, Township 1 South, Range 67 West, of the 6<sup>th</sup> Principal Meridian, on 144<sup>th</sup> Avenue, in the town of Thornton in Adams County, Colorado (see Figure 1). The Site surrounds the former FRI 2-18 wellhead and tank battery and is approximately 950 feet (ft.) north of 144<sup>th</sup> Avenue and 1,200 ft. west of Holly Street. The approximate coordinates of the Site are 39.960732°, -104.926776°.

On November 4, 2013 Noble was informed of the suspected release. Subsequently, Noble filed a Form 19 Spill/Release Report (Form 19) with the COGCC for the incident. On November 13, 2013 the Form 19 was received by the COGCC and the incident was designated Spill/Release Tracking Number 2147193.

Based on procedures established via the Form 19 process, Noble conducted subsurface Site assessment activities from October 2013 through April 2014 in order to delineate the extent of petroleum hydrocarbon impacts at the Site. A total of 49 monitoring wells were installed at the Site throughout the assessment phase. The locations of these monitoring wells are presented in Figure 2. Laboratory analytical data for soil samples collected during the monitoring well installation are reported in the 4Q2017 Table 1 and total petroleum hydrocarbon (TPH) concentrations are reported in the 4Q2017 Figure 5. In addition to groundwater and soil assessment activities, Noble initiated interim corrective measures to reduce the presence of LNAPL in the central region of the Site.

On May 9, 2014 Noble submitted a Form 27 Site Assessment Report (Document Number 2148980) for COGCC review. Subsequently, COGCC approved the Form 27, closed out Spill/Release Tracking Number 2147193, and issued Remediation Number 8440 for continued remediation, monitoring, and reporting at the Site.

## **1.2 Site Topography, Geology, and Hydrogeology**

The Site is positioned at approximately 5,246 ft. above mean sea level (AMSL). Surface topography slopes gradually to the north across the Site with minor depressions evident across the ground surface. Regional topography slopes to the north and northwest from a high point approximately 2,000 ft. south of 144<sup>th</sup> Avenue. Surface drainage features are evident to the north and east of the Site and follow a general northeast – southwest trend.

Site assessment borings indicate that the subsurface geology immediately beneath the Site is composed of unconsolidated alluvial sediments and evaporite deposits overlying consolidated sedimentary rock. The upper unconsolidated unit is observed from ground surface to approximately 35 ft. below ground surface (bgs) and consists of interbedded clays (CL), fine, medium, and coarse grain sands (SC, SP, SW), and zones of accreted caliche. The alluvial and precipitated sediments are underlain by interbedded sandstone and claystone encountered at approximately 35 ft. bgs. The depth of the competent bedrock surface observed in the majority of the borings varies from approximately 25 to 40 ft. bgs across the Site and is generally characterized by a poorly cemented fractured sandstone layer approximately 10 to 15 ft. thick underlain by claystone. Claystone dominates the consolidated interval in the southeastern and eastern portions of the Site, while sandstone is the predominant consolidated lithology noted across the central and western regions. Thickening of the sandstone layer appears to follow a north - south trend across the area of concern. Two wells, SB06 and SB17, did not encounter bedrock. Boring logs for monitoring wells SB01 through SB42 are included in Attachments A and B of the Form 27 Site Assessment Report (Document Number 2148980) submitted to the COGCC on May 9, 2014.

The groundwater table is generally encountered between 40 and 50 ft. bgs within the consolidated sedimentary rock units. Groundwater flow appears preferential to the poorly cemented sandstone layer and appears to be preferentially bound to the central and western portions of the Site. This preferential flow and accumulation is further evidenced by dry and slow re-charging wells in the southeast and eastern portions of the Site (predominated by the lower permeability claystone lithology). Well yields across the majority of the Site are relatively low, consistent with a consolidated bedrock aquifer; however, higher flow rates have been observed, suggesting secondary flow pathways and geologic structures may be contributing factors in groundwater transport.

## **2.0 GROUNDWATER SAMPLING ACTIVITIES**

This section summarizes the groundwater sampling activities that were performed, and the protocols followed during groundwater monitoring activities conducted by Tasman during the second quarter 2018. Sampling activities included measurement of groundwater/LNAPL depths, measurement of groundwater quality parameters, and collection of groundwater samples from Site monitoring wells.

## **2.1 Groundwater Sample Locations**

Site-wide groundwater monitoring and associated events were conducted between May 18 and 21, 2018. The following sections discuss the field and laboratory analytical procedures followed during this event.

- On May 11, 2018, the Site remediation system (System) was shut off to allow Site subsurface conditions to equilibrate prior to conducting the groundwater sampling event.
- On May 11, 2018, all product recovery pumps were removed from recovery wells to allow for LNAPL gauging to be completed in the product recovery wells during the groundwater sampling event.
- On May 18, 2018, a Site-wide fluid level gauging event was conducted. Groundwater and LNAPL measurements were collected from all Site monitoring and product recovery wells.
- On May 18, 2018, HydraSleeve groundwater sampling devices were deployed in all Site monitoring wells exhibiting the required conditions described in Section 2.3. Wells receiving HydraSleeves included:

• SB03	• SB04	• SB06	• SB07
• SB08	• SB10	• SB11	• SB12
• SB13	• SB14	• SB15	• SB17
• SB19	• SB20	• SB22R	• SB25R
• SB27R	• SB28R	• SB36	• SB38
• SB39			
- On May 21, 2018, the HydraSleeves were retrieved from the monitoring wells listed above and groundwater samples were collected and submitted for laboratory analysis. At the same time, field groundwater quality parameters were gauged in-situ at the well locations listed above except SB28R. Monitoring Wells SB19 and SB28R contained an obstruction that allowed a HydraSleeve past, however it blocked the deployment of the In-Situ Smart Troll probe.

Historic groundwater monitoring well locations notes of concern:

- Throughout the Site assessment, monitoring wells SB16, SB22, SB24, SB25, SB27, and SB28 have failed to produce sufficient water for well development or sampling activities. Review of the boring logs shows that construction of these wells was either too shallow or completed in an area of low permeability. These wells were abandoned in June 2015 following review of all previous Site field and laboratory analytical data.

- Monitoring well SB20R was abandoned in June 2015, following review of all previous Site field and laboratory analytical data. In prior sampling events, SB20R was not sampled due to the immediate proximity of SB20.
- Monitoring wells SB01 and SB02 were consistently found to contain groundwater levels above the perforated interval of the well casing. These wells were abandoned in June 2015, following review of all previous Site field and laboratory analytical data.
- Monitoring well SB16 has failed to produce sufficient water to sample since its installation. In January 2014 monitoring well SB16 was abandoned and monitoring well SB16R was drilled as a replacement. However, the casing of SB16R was damaged and the well could not be gauged or sampled. In April 2017 monitoring well SB16R was abandoned and monitoring well SB16R2 was installed. Monitoring well SB23 also failed to produce sufficient water for sampling and was abandoned in April 2017. Monitoring well SB23R was drilled as a replacement in April 2017.
- The COGCC approved removal of periphery wells (SB18, SB24R, SB26, SB29, SB33, SB34, SB35, SB40, SB41, and SB42) from the monitoring network on April 4, 2017.

## **2.2 Groundwater and LNAPL Gauging**

Groundwater levels are measured (i.e. gauged) in order to evaluate hydraulic characteristics and to provide information regarding seasonal and annual fluctuations in groundwater elevations at the Site. Groundwater and LNAPL levels were measured on the north side of the well casing to the nearest 0.01-foot using a float driven oil-water interface probe (IP). Groundwater and LNAPL level data were subsequently converted to elevations (ft. AMSL) by subtracting the measured depth from the well's top-of-casing (TOC) elevation survey datum. Groundwater elevations for wells exhibiting detectable LNAPL levels were corrected for the effects of LNAPL depression of the potentiometric surface. These groundwater elevations were corrected using the following formula:

$$\begin{aligned}
 & (\text{Top of Casing Elevation} - \text{Measured Depth to Water}) \\
 & + (\text{LNAPL Thickness in Well} \times \text{LNAPL Relative Density}) \\
 & = \text{Corrected Groundwater Elevation}
 \end{aligned}$$

An LNAPL relative density of 0.75 was used, based on petrophysical quantitation conducted during the initial Site assessment.

Groundwater quality measurements were collected in the field following groundwater sample collection using a Smart Troll multi-parameter instrument with a 100 ft. tethered probe to allow for in-situ measurements. Field measurements for temperature, electrical conductivity (EC), pH, oxidation reduction potential (ORP), and dissolved oxygen (DO) were measured in-situ at monitoring wells with sufficient groundwater column. These measurements were not collected from monitoring locations exhibiting detectable levels of LNAPL.

## **2.3 Groundwater Sample Collection**

Prior to collecting groundwater laboratory analytical samples, groundwater and LNAPL levels were measured at each of the Site monitoring wells, as previously described. The presence of LNAPL was evaluated and wells exhibiting detectable levels of LNAPL were removed from the laboratory analytical sample collection list.

Groundwater monitoring wells were sampled using individual, disposable, HydraSleeve sample collection devices. Evaluation of the water column height within the well was performed prior to sampler placement in order to maintain sample consistency from well to well and between subsequent sample collection events. HydraSleeves were deployed in a manner limiting sample collection to the top four feet of the water column by restricting the length of the HydraSleeve retrieval tether to no more than four feet longer than the measured depth to water. The procedural basis for how groundwater samples were collected using Hydrasleeve sample collection devices is provided below:

- Samples collected from monitoring wells with a water column height greater than or equal to seven ft. were sampled using a standard 2-inch HydraSleeve (2.5 inches [W] x 30 inches [L]) with five ounce (oz.) (2.5 inches [L]) bottom weights attached via a 2-inch stainless steel clip.
- Samples collected from monitoring wells with a water column height less than seven ft. and greater than two ft. were sampled using a standard 2-inch HydraSleeve (2.5 inches [W] x 30 inches [L]) with five oz. (2.5 inches [L]) bottom weights attached via a 2-inch stainless steel clip. Due to the reduced water column height, HydraSleeves were deployed with a 16 oz. top weight, intended to keep the valve inlet positioned within four ft. of the phreatic surface.
- Monitoring wells with a water column height less than 2 ft. were not sampled as per the Site standard operating procedures due to insufficient sample volume.

Retrieval of the HydraSleeves and collection of the laboratory samples was performed no earlier than 48 hours and no later than 96 hours subsequent to HydraSleeve deployment. Clean sample containers (40-milliliter [ml] volatile organic analysis [VOA] vials) supplied by the analytical laboratory were used to contain liquid for subsequent analyses. VOA vials were overfilled and capped to reduce the potential for any headspace and to prevent the loss of volatile analytes. Sample bottles were then labeled with corresponding date, time and well identification, and placed in an ice-filled cooler and maintained at approximately 4 degrees Celsius ( $^{\circ}\text{C}$ ) for transportation. The groundwater samples were packed and delivered for analysis under chain-of-custody procedures to the contract laboratory.

Groundwater samples were submitted to Summit Scientific Laboratory in Golden, Colorado for analysis of benzene, toluene, ethylbenzene, and total xylenes (collectively referred to as BTEX) using United States Environmental Protection Agency (USEPA) Method 8260B.

Groundwater sample quality assurance/quality control (QA/QC) procedures were performed via a two-step process. Laboratory QA/QC was performed in accordance with the laboratory's standard internal QA/QC program. Following receipt of laboratory analytical data reports, Tasman performed an internal QA/QC evaluation.

## **3.0 GROUNDWATER SAMPLING RESULTS**

This section presents the results of the second quarter 2018 groundwater sampling activities described above.

### **3.1 Fluid Level Measurements**

Fluid elevation data generated from the Site-wide groundwater and LNAPL gauging event conducted on May 18, 2018 was processed and converted to piezometric elevation in ft. AMSL. The data collected from this event were then used for Site hydrogeologic evaluation purposes. This evaluation was particularly focused on delineation of the LNAPL plume present across the central region of the Site as well as the flow characteristics of groundwater and dissolved phase contaminant migration. Groundwater elevations and LNAPL thicknesses are presented in Table 1 and LNAPL thicknesses are illustrated in Figure 3. Figure 3 also illustrates LNAPL thickness across the Site for the previous two quarters.

LNAPL was detected on May 18, 2018 in eight Site monitoring wells (SB05, SB09, SB16R2, SB21, SB23R, SB30, SB31 and SB37). Product thickness in these wells ranged from 0.02 ft. at SB09 to 4.50 ft. at SB30. LNAPL was also detected in 21 product recovery wells (PR01, PR02, PR03, PR05 through PR19, and PR24 through PR26), at thicknesses ranging from 0.02 feet in PR13 to 2.79 feet in SB16. LNAPL thickness measured during the second quarter 2018 sampling event across the Site is illustrated in the bottom third of Figure 3.

During the May 18, 2018 gauging event, groundwater elevations ranged from a low of 5,199.21 ft. AMSL in PR20 to a high of 5,214.64 ft. AMSL in SB40. Hydraulic analysis of the groundwater elevation data generated for the Site was used to create a groundwater potentiometric surface contour map. These contours show hydraulic gradient components flowing to the southwest. The average hydraulic gradient across the Site was calculated at approximately 0.02 feet per foot between SB40 and SB34. Groundwater potentiometric surface contours are illustrated in Figure 4. Monitoring wells marked as abandoned on Figure 2 as well as those containing less than 0.5 ft. of groundwater column were not used for contouring purposes.

### **3.2 Groundwater Quality Parameter Measurements**

Field groundwater quality parameters (temperature, EC, pH, ORP, and DO) were measured in-situ at the Site on May 21, 2018 following groundwater sample collection. A summary of field groundwater quality parameter measurements collected by Tasman is presented below and in Table 2:

- Groundwater temperature measurements at the Site ranged from 13.85 degrees Celsius (°C) at SB38 to 19.46 °C at SB14, with an average temperature of 16.52 °C.
- Groundwater EC measurements at the Site ranged from 1.59 millisiemens per centimeter (mS/cm) at SB22R to 5.59 mS/cm at SB17, with an average EC of 3.65 mS/cm.
- Groundwater pH measurements at the Site ranged from 6.57 at SB10 to 7.51 at SB25R, with an average pH of 7.12.
- Groundwater ORP measurements at the Site ranged from -197.90 millivolts (mV) at SB36 to 77.90 mV at SB06, with an average ORP of -39.72 mV.
- Groundwater DO measurements at the Site ranged from 0.02 milligrams per liter (mg/L) at SB12 to 0.74 mg/L at SB15, with an average DO of 4.23 mg/L.

### **3.3 Laboratory Analytical Results**

Groundwater laboratory analytical data is presented in Table 3. The laboratory analytical report is provided in Attachment A. A summary of the groundwater laboratory analytical data collected by Tasman is presented below:

- Benzene was detected above the COGCC Table 910-1 standard of 5 micrograms per liter ( $\mu\text{g}/\text{L}$ ) in four (4) of the 21 Site monitoring wells sampled. Benzene concentrations associated with these four monitoring wells ranged from 14  $\mu\text{g}/\text{L}$  in SB22R to 5,100  $\mu\text{g}/\text{L}$  in SB08. Benzene analytical results and isoconcentration contours indicating the area where benzene concentrations exceed the COGCC regulatory standard are illustrated in Figure 5.
- Toluene was not detected above the COGCC Table 910-1 standard of 560  $\mu\text{g}/\text{L}$  in any of the 21 Site monitoring wells sampled.
- Ethylbenzene was not detected above the COGCC Table 910-1 standard of 700  $\mu\text{g}/\text{L}$  in any of the 21 Site monitoring wells sampled.
- Total xylenes were detected above the COGCC Table 910-1 standard of 1,400  $\mu\text{g}/\text{L}$  in one (1) of the 21 Site monitoring wells sampled in addition to the DUP Sample. The total xylenes concentration associated with SB08 and its DUP were 9,700  $\mu\text{g}/\text{L}$  and 8,100  $\mu\text{g}/\text{L}$ , respectively.

### **4.0 INTERIM REMEDIAL ACTION**

This section summarizes remediation activities conducted at the Site from November 2013 to May 2015. Concurrently, a full-scale remediation system was designed and constructed. Interim remedial measures were suspended between June 2015 and February 2016 due to construction

activities and final completion of the full-scale system. Construction of the full-scale system was completed on February 22, 2016.

#### **4.1 Interim LNAPL Recovery**

Four Magnum Spill Buster automated LNAPL pumping systems were installed at the Site between November 2013 and May 2015. The pumps were specifically designed to remove LNAPL from the water table.

Due to the lack of electrical service at the Site, Spill Buster pumps were operated through the use of solar power. Recovered LNAPL was pumped into 250-gallon polyethylene tanks dedicated to each pumping unit. Once full, LNAPL holding tanks were emptied using a vacuum truck and the fluid was transported to a licensed E&P waste facility for disposal.

Spill Buster systems were removed from the Site in May of 2015. A total of approximately 1,960 gallons of LNAPL were recovered between November 2013 and May 2015.

### **5.0 REMEDIATION SYSTEM OPERATION**

The System is capable of automated LNAPL recovery using a pneumatic pumping system, soil vapor extraction (SVE), and total fluids recovery (TFE). The System was designed to operate in a phased remediation sequence starting with LNAPL recovery, transitioning to SVE, and finally TFE. The LNAPL recovery portion of the System is currently in operation with the SVE scheduled to come on line in the third quarter of 2018.

#### **5.1 LNAPL Recovery**

The LNAPL recovery component of the System was put into 24-hour operation on February 29, 2016. Two Clean Earth Technology Magnum Spill Busters were installed during the Second Quarter 2018. The Spill Busters were operated in conjunction with the full-scale remediation System to help augment LNAPL recovery outside the core product recovery (PR) well network. The Spill Buster units are periodically operated at SB05, SB09, SB21, SB30, and SB31 based on optimal LNAPL thickness and recovery rate exhibited at each well location.

A significant amount of impacted groundwater and LNAPL have been recovered at the Site going back to November 2013. Spill Busters were used at the Site shortly after the release was detected in November 2013 and the volume of groundwater and LNAPL recovered increased significantly once the System was brought on line in February 2016. As illustrated in Figure 6, as of May 18, 2018, approximately 6,500 gallons of impacted groundwater and approximately 5,500 gallons of LNAPL have been recovered at the Site since 2013. As indicated in the graph below, when System operations were initiated, the volume of impacted groundwater and LNAPL that was recovered nearly doubled from 2016 to 2017. The System, along with the Spill Buster pumps continue to steadily recover impacted groundwater and LNAPL.

On average, LNAPL thickness across the Site have decreased since 2013. Operation of the Spill Busters and the System have been instrumental in addressing LNAPL across the Site and removing a significant amount of petroleum hydrocarbon mass. Positive trends associated with operating the System at the site include:

- Of the twenty three (23) PR wells that have had measurable LNAPL in them since 2014, LNAPL thickness has dropped steadily in twelve (12) of these wells;
- Of these 12 wells, LNAPL thickness has dropped on average by over 6 feet; and
- In nine (9) of the 23 PR wells that have historically had LNAPL thicknesses over 2 feet, as of the second quarter 2018, nine (9) of these wells now have less than or equal to 0.50 feet of LNAPL present.

The System has been successful at stabilizing the overall area where LNAPL has been encountered at the Site and LNAPL has not been detected in new wells where LNAPL was not been measured historically. As additional components of the System are brought online during the third quarter 2018, it is anticipated that enhanced LNAPL recovery will be achieved.

## **6.0 UPCOMING SITE ACTIVITIES**

Anticipated upcoming Site activities for the third quarte 2018 include:

- Initiating operation of the SVE component of the System. Decreased LNAPL thicknesses across the Site to marginal or non-detect levels provides justification to initiate operation of SVE in select PR wells;
- Collecting air emission samples and submitting an application for a construction permit to the Colorado Department of Public Heath and Environment, Air Pollution Control Division;
- Re-developing certain PR wells to help enhance LNAPL recovery;
- Evaluating the implementation of the total fluids extraction component of the System; and
- Completing the third quarter 2018 groundwater sampling event in August.

SB42	05/18/18	32.64	ND	0.00	59.43	5244.19	5211.55

**Notes:**

DTW = Depth to water

DTP = Depth to Product (LNAPL)

ft. BTOC = Feet below top of well casing

ft. AMSL = Feet above mean sea level

TD = Total depth of well below top of well casing (based on the most recent measurement)

LNAPL = Light non-aqueous phase liquid

ND = Not detected

NM = Not measured

DRY = Well contained less than 0.5 feet of water

\* Groundwater elevation was corrected for product thickness when present using the following calculation:

Groundwater elevation = (TOC Elevation - Measured Depth to Water) + (LNAPL Thickness x LNAPL Relative Density)

LNAPL relative density was measured to be approximately 0.75

<sup>1</sup> LNAPL detected in groundwater sample collected on 02/22/16

<sup>2</sup> Well SB16R obstructed above oil/water interface, groundwater not encountered above obstruction

<sup>3</sup> LNAPL thickness is approximate, checked with bailer

<sup>4</sup> Total Depth of Well is only measured for wells that are to be sampled.

This table presents data collected by Tasman Geosciences. Historical data is presented in Attachment A of the Form 27 Site Assessment Report (COGCC Document #2148980)

SB42	05/09/17	Not Measured - Removed From Groundwater Monitoring Program				

**NOTES:**

Temp (°C) = Temperature in degrees Celsius (°C)

EC (mS/cm) = Electrical conductivity in millisiemens per centimeter (mS/cm)

pH = Acidity or alkalinity in standard units

ORP (mV) = Oxidation reduction potential in millivolts (mV)

DO (mg/L) = Dissolved oxygen concentration in milligrams per liter (mg/L)

LNAPL = Light non-aqueous phase liquid

<sup>1</sup> Measured ex-situ due to the presence of LNAPL

<sup>2</sup> pH values appear anomalous for wells SB07, SB10, SB14, SB15, SB20 measured on 11/24/15, and for well SB11 on 5/23/16.

<sup>3</sup> DO values appear anomalous for wells SB07, SB08, SB10 measured on 02/22/16, and for well SB07 measured on 5/23/16.

<sup>4</sup> Obstruction in well large enough to block meter sensor, but did not block hydrasleeve deployment.

This table presents data collected by Tasman Geosciences. Historical data is presented in Attachment A of the Form 27 Site Assessment Report (COGCC Document #2148980)

Trip Blank	05/21/18	<1.0	<1.0	<1.0	<2.0

**Notes:**

COGCC = Colorado Oil and Gas Conservation Commission

$\mu\text{g/L}$  = Micrograms per liter

< = Analytical result is less than the indicated laboratory reporting limit

LNAPL = Light non-aqueous phase liquid

DUP = Duplicate sample

<sup>1</sup> Well obstruction large enough to block meter sensor, small enough to allow hydrosleeve deployment.

<sup>2</sup> Tasman recommended a reduced groundwater monitoring well network to Noble Energy on March 29, 2017 based on historical groundwater data.

<sup>3</sup> Diluted sample run was analyzed outside of holding time, but results are comparable with previous quarter. Therefore, sample results are viewed as estimated, but acceptable.

Groundwater standards referenced from COGCC Table 910-1

**Highlighted results exceed the COGCC Table 910-1 standard**

This table presents data collected by Tasman Geosciences. Historical data is presented in Attachment A of the Form 27 Site Assessment Report (COGCC Document #2148980)

**Sample Receipt Checklist**

S2 Work Order: 1805259

Client: Noble Tasman Client Project ID: FRI Z-18

Shipped Via: PICKUP Airbill #: \_\_\_\_\_  
(UPS, FedEx, Hand Delivered, Pick-up, etc.)

Matrix (check all that apply): Air Soil/Solid  Water Other: \_\_\_\_\_  
(Describe)

Temp (°C)	<u>15.2</u>
-----------	-------------

Thermometer ID: 61857155-K

	Yes	No	N/A	Comments (if any)
If samples require cooling, was the temperature at 4°C +/- 2°C <sup>(1)</sup> ?	<input checked="" type="checkbox"/>			
NOTE: If samples are delivered the same day of sampling, this requirement is met provided that there is evidence that cooling has begun.		<input checked="" type="checkbox"/>		
Were all samples received intact <sup>(1)</sup> ?	<input checked="" type="checkbox"/>			
Was adequate sample volume provided <sup>(1)</sup> ?	<input checked="" type="checkbox"/>			
If custody seals are present, are they intact <sup>(1)</sup> ?		<input checked="" type="checkbox"/>		
Are samples with holding times due within 48 hours sample due within 48 hours present?		<input checked="" type="checkbox"/>		
Is a chain-of-custody (COC) form present and filled out completely <sup>(1)</sup> ?	<input checked="" type="checkbox"/>			
Does the COC agree with the number and type of sample bottles received <sup>(1)</sup> ?	<input checked="" type="checkbox"/>			
Do the sample IDs on the bottle labels match the COC <sup>(1)</sup> ?	<input checked="" type="checkbox"/>			
Is the COC properly relinquished by the client w/ date and time recorded <sup>(1)</sup> ?	<input checked="" type="checkbox"/>			
For volatiles in water – is there headspace present? <b>If yes, contact client and note in narrative.</b>		<input checked="" type="checkbox"/>		
Are samples preserved that require preservation (excluding cooling) <sup>(1)</sup> ?		<input checked="" type="checkbox"/>		
Note the type of preservative in the Comments column – HCl, H <sub>2</sub> SO <sub>4</sub> , NaOH, HNO <sub>3</sub> , ect				
If samples are acid preserved for metals, is the pH ≤ 2 <sup>(1)</sup> ? Record the pH in Comments.			<input checked="" type="checkbox"/>	
If dissolved metals are requested, were samples field filtered?			<input checked="" type="checkbox"/>	
Additional Comments (if any):				
(1) If NO, then contact the client before proceeding with analysis and note in case narrative.

### Notes and Definitions

DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
