Randy,

In follow up to our conversation today, please submit a Form 4 to complete the down hole work that you indicated (cemented 4-1/2" liner). Additionally, based on the photos provided by Steve Freese at SLB, and your description that fluid keeps flowing into the hole despite a downhole packer, in accordance with Rule 906, this spill should be reported on a Form 19; please submit as soon as possible--it should have been reported as a spill as soon as the volume reached 1 bbl. COGCC wants to make sure the source is identified and stopped and that any impacts are fully delineated and cleaned up in accordance with the 900-Series Rules.

Lastly, when COGCC inspected this well on February 8, 2018, there appeared to be new gravel or fill dirt placed around the wellhead. Can you please describe the work that was done prior to that inspection--is that the excavation to investigate a possible flowline spill that you indicated when we spoke today? Has additional work been done since then?

Thanks for your cooperation.

Greg
