Chris:

The three proposed Boise Ranch locations (335605, 335681 and 315565) and the associated wells fall outside of areas CPW classifies as Sensitive Wildlife Habitat. In addition, because the proposed wells would be drilled from existing locations, and because there is existing oil and gas infrastructure in the project area (producing well density in the project area is approximately 7 producing wells per square mile, and road density in the project area is approximately 2.0 miles of roads per square mile), CPW does not recommend any site-specific wildlife mitigation be applied to these locations.

Brett
