Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

A slug of water was pushed to the Ellison location and overflowed the tank on location. The excess water was fully contained in the berm. Petrox believes that one of the below surface lines froze during the night and during the morning of 1/6/2019 it thawed causing a large slug of water to fill the tank. Petrox is still investigating the cause but will have the exact cause for the supplemental spill report. 60 bbls were pulled from the berm and disposed of at the Tierra Piedra #15-1 SWD facility. Water flow rates returned to normal shortly after the slug. The location recently was upgraded from a 250 bbl to 400 bbl tank, which minimized spill volume. A remediation plan will be determined when the root cause is identified.
