COMMENTS:

This is a bi-weekly report required by a COGCC inspection (document number 682404500).

Noble met with the landowner on May 29, 2019 at the location. The landowner expressed concerns that regrading efforts had removed 5 inches of topsoil from the location. Based on the survey data collected before and after re-grading activities and previously submitted to COGCC, it does not appear that 5 inches of topsoil was removed. From a visual inspection, the disturbed area appears to match the surrounding field and will promote good drainage for flood irrigation.

The landowner also expressed concerns about a compacted layer beneath the topsoil. Noble explained that the deep ripping and cross-ripping is meant to de-compact the soil. The landowner has agreed to allow deep-ripping and cross-ripping for decompaction.

The landowner was concerned about the presence of rocks in the subsurface; however, rocks commonly occur in subsoils. The sample data collected and submitted to COGCC suggests that the soil texture and soil organic matter content is consistent between the disturbed area and the adjacent field. However, at the landowner's request, Noble will evaluate soil textures and/or collect additional samples from the re-graded area to evaluate the suitability of the soil for alfalfa growth.

The landowner has provided a registration number to allow the use of Roundup-Ready seed; however, decompaction and seeding has been delayed due to weather. Noble will de-compact and seed once equipment can be brought on location without negatively impacting the work area.
