#### COMMENTS:

The Thistle Down 31i-302 is currently pending stimulation operations. The well and its monitoring/mitigation plan is as follows:

1. In January 2019, the bradenhead was reported to COGCC with 350 psig which then PDC has been gathering data to help determine best solution for wells with BH pressure.
2. At the 6 month post rig release test the bradenhead was recorded at 430 psig which is most likely accounted for due to change in ambient temperature and additional slow build up.
3. Since that test, multiple blow downs have been done indicating the presence of no fluid and quick blow down to zero pressure. The build ups after indicate the pressure is slowly being worked off.
4. Per our conversation with the COGCC we will proceed with said stimulation and monitor all bradenheads with automation for a 100 psig increase.
5. After completions has completed, the pad will be commissioned for a bradenhead pressure abatement system that combusts bradenhead gas via VRU system with bradenhead gas routed to a working tank to keep pressure below 50 psi threshold. The abatement system will be in place for 6 months, at which time PDC will complete a reevaluation of pressure to determine if further mitigation is required. Buildup and duration of pressure will be monitored via automation system and PDC will contact COGCC engineer if pressure increases at any time.
