Best Management Practices

No	BMP/COA Type	Description
1	Drilling/Completion Operations	Green Completions (Rule 604.c.(2)C. Test separators and associated flow lines, sand traps and emission control systems shall be installed on-site to accommodate green completions techniques. When commercial quantities of salable quality gas are achieved at each well, the gas shall be immediately directed to a sales line or shut in and conserved. If a sales line is unavailable or other conditions prevent placing the gas into a sales line, Bonanza Creek shall not produce the wells without an approved variance per Rule 805.b.(3)C
2	Material Handling and Spill Prevention	Sensitive Area Determination: 1) Well Pad Construction – Bonanza Creek constructs its locations with a compacted road base surface. This surface is at least 4 inches thick and compacted to prevent surface degradation from drilling and production activity and traffic. This layer of road base protects shallow groundwater by containing liquids and preventing vertical migration of a potential spill. 2) Tank Battery Containment –To protect shallow groundwater, the existing produced fluid storage and any new storage will be constructed within lined containment. 3) Separation Equipment Containment - All produced fluids will be routed to separation equipment. To protect shallow groundwater, Bonanza Creek uses separators with built-in containment.
3	Material Handling and Spill Prevention	Leak Detection Plan: Bonanza Creek personnel are on location routinely conducting operations and maintenance activity. If any leaks were to occur on site, they would be quickly identified by Bonanza Creek personnel. Bonanza Creek utilizes SCADA information systems that have the ability to remotely monitor well production onsite and activate specific valves, which can shut-in production wells and stop a release on location. In addition to routine operations and maintenance performed at the location, Bonanza Creek conducts required inspections for SPCC, Stormwater, and LDAR compliance.
