COMMENTS:

The 2020 annual bradenhead test dated 7/7/2020, had an initial pressure over 50psi. Based on the 2019 annual bradenhead test results, Extraction implemented a bradenhead blowdown mitigation strategy outlined in Form 4 DOC#: 402237383. The attached chart shows the results of this mitigation strategy. The blowdown mitigation was unable to maintain bradenhead pressures below the 50psi threshold outlined in Operator Guidance Order 1-232. The following information was gathered during the blowdown: Flowrate of 25.5MSCF/D Volume of 0.175MSCF. To comply with the operator guidance Extraction intends to route the bradenhead gas to a combustor at the facility via the existing flowline.

The Young 4-31 bradenhead gas sample indicates a mixture of thermogenic and microbial gas. When compared to the production gas sample taken, the bradenhead gas sample is less thermally mature indicating it is sourced from a shallower formation in the well, when compared to the production gas sample taken from the J-Sand-Niobrara-Codell Completed intervals.
