**COMMENTS:**

TEP Rocky Mountain LLC (TEP) requests a design change to the Federal RG 344-7-297 wellbore. TEP's proposal with respect to well design, encompasses drilling a 17-1/2" surface section to approximately 1440' and running 13-3/8" surface casing to ~200 ft above the dissolution loss zone. This would enable TEP to set this surface casing and establish effective cement returns to surface avoiding further doubt of cement integrity and remedial operations. That would provide a competent surface shoe in place as well as the option to nipple up the BOP for a secure air drilled intermediate section through the highly fractured dissolution zone. The 12-1/4" intermediate section would be drilled to the original permitted depth at approximately 3281' (500' into Wasatch) followed by running 9-5/8" 36# J-55 intermediate casing - functioning as a fracture gradient isolation contingency string. The purpose of cement for the 9-5/8" intermediate contingency string is to provide sufficient drilling mud weight at TD for the following production section and TOC is planned to be 500 ft above the Wasatch formation and utilizing 50% excess with a single stage slurry.

Hole design:

Surface hole size 17.5" to ~1440' MD and approx. 200' above Dissolution Surface.

Surface casing – 13.375", J-55, BTC, 54.5#

Intermediate hole size – 12.25" to TD 500' into the Wasatch same as permitted.

Intermediate casing – 9.625", J-55, LTC, 36# is the same specs as permitted.

Cement design:

Surface Casing – 12.3# Single stage slurry with 40% excess

Intermediate – Single stage slurry

12.3# Lead with TOC ~500' MD above the Wasatch with 50% excess.

12.8# Tail from TD to 500' above float shoe.

Note: Directional plans are on file and have not changed. The Blow Out Preventer (BOP) will be changed out from an 11" 5K to a 13 5/8" 5K BOP.
