Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

The check valve on the injection pump failed, allowing fluids to bypass the pump and re-enter the produced water storage tanks. The facility's callout system failed and no high-level alarm notifications were made to the operator. The produced water tanks overflowed into oil storage tanks. Once all facility liquid storage was utilized, all tanks overflowed and total of 168 barrels (BBLs) of fluid were released. 154 BBLs of produced water and six (6) BBLs of oil were held within containment. Four (4) BBLs of produced water and four (4) BBLs of oil overtopped the containment and flowed off of the location to the southwest. Upon discovery, the tank battery and all associated wells were shut-in to stop production. A vactruck was used to remove all free liquids; 158 BBLs of produced water and ten (10) BBLs of oil were recovered.
