Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

In compliance with Rule 911.b, while conducting a facility decommissioning site assessment of the North Platte 44-11-28HZ production facility (Form 27 Remediation Project #17424) historical soil impacts were identified near the northwest corner of the production tank containment. Initial field screening did not display signs of a historical release. However, analytical results indicate TPH exceedances in SS05. The extent of the subsurface release will be vertically and laterally delineated. This is historic cumulative impact that developed over the lifetime of the facility and not from a single event. The impacted soil will be removed and additional confirmation soil samples will be collected and submitted for laboratory analysis. Analytical results will be included in a supplemental Form 19.
