Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

The leak was discovered on the Bison Boomslang 14B well pad on 08/18/2021. It was determined to be from the Taproot Produced Water Transfer system. The system was shut down, isolated, and cleanup began. Most of the spill was contained on pad and within the retention pond built with the pad. Initial indications are that a section of 6" Thermoflex 750 psi pipeline had buckled, and the thin spot created by the buckling failed at about 482 psig (well below the 750 psig rating). The piping has been in service since January of 2020. Taproot is currently evaluating repair/replacement options including hydrotesting to locate additional weak spots.
