#### COMMENTS:

Verdad respectfully requests to flare intermittently over the next 3-4 weeks during initial flowback ~50mcf of gas. This will be through an enclosed flare. It is necessary to flare the gas because the gas is not produced in sufficient quantities or at too irregular of intervals to be sent to the permanent facility/ sales. Once the wells line out and are producing salable volumes of gas, it will be directed to sales. See BMP for additional information.

### Description

1	Emissions mitigation	<p>Operator will utilize best practices to maximize resource recovery and mitigate releases to protect and minimize adverse impacts to public health, safety, welfare, the environment and wildlife.</p> <ul style="list-style-type: none"><li>• Initial frac and drill out effluent is routed through a sand catcher/trap and a junk/sand tank to remove sand and well frac debris.</li><li>• Once any hydrocarbons are detected but prior to encountering salable quality combustible gas or significant volumes of liquid hydrocarbons (condensate or oil greater than 10 barrels per day average) the effluent is routed through a high-pressure separator and closed-top tanks to minimize emissions to the environment. Hydrocarbon liquids, produced water, and sand are separated utilizing the High- pressure separator.</li><li>• The quality (combustibility) of the gas is typically monitored directly at the High-pressure separator. When salable (combustible) quality gas is measured/detected, the gas stream is immediately diverted to the sales pipeline or the well is shut in. In the event the gas will need to be flared beyond flowback, an approved Form 4 Sundry will be obtained prior to flaring.</li><li>• The separated produced water and hydrocarbon liquids (condensate/oil) are directed to specific tanks for storage until being unloaded and hauled to disposal or sales as appropriate.</li></ul>
