COMMENTS:

The bradenhead test completed on August 8th, 2021 exceeded the threshold pressure for a critical area (5 psi) with a surface casing pressure of 69 psi (test form attached). This is 69 psi higher than the surface casing pressure observed in 2019 (0 psi). After 2 seconds of venting, the surface casing pressure blew down to no flow. Gas samples were taken and revealed that the surface casing and production casing gases are dissimilar (gas analysis attached). The methane mole % from the production casing is 95% with a low Nitrogen content (0.09 mol%) and a moderate CO2 content (3.9 mol%); whereas the surface casing methane content was 98% with a larger Nitrogen content (0.39 mol%) and a small CO2 content (0.01 mol%). These compositional differences suggest that the surface casing gas is coming from a different source that is not communicating with the producing zone. The bradenhead pressure blew down to no flow in 2 seconds. This very brief blowdown time is indicative of a very small volume. Red Willow proposes leaving this bradenhead shut in and re-evaluating this situation during the 2023 bradenhead program.
