**PROPOSED SAMPLING PLAN****Proposed Soil Sampling**

☒ Will soil samples be collected as part of this investigation? ( Number, type (grab/composite), analyses, and locations of samples ):

Caerus plans to complete source removal via excavation of the previously delineated hydrocarbon impacts associated with the KRK 7-7A Dumpline Release which are located immediately below and west of the separator production equipment. The attached report of work completed (ROWC) details the final delineation soil sampling activities completed on 1/6/2022. The number of excavation confirmation soil samples will be based on Table 1 referenced in the Colorado Oil and Gas Conservation Commission (COGCC) Rule 915.e.(2) - Soil Sampling and Analysis Guidance Document. All soil removed during excavation activities will be characterized through visual and olfactory observations and field screening soil samples for volatile organic compounds using a photoionization detector (PID). All samples will be submitted under the Directors latest approved reduced suite which can be referenced in COGCC Document Number 402898845.

## REMEDIAL ACTION PLAN

Does this Supplemental Form 27A include changes to a previously approved Remedial Action Plan? No

## SOURCE REMOVAL SUMMARY

Describe how source is to be removed.

The source is a dumpline which will be replaced.

## REMEDATION SUMMARY

Describe how remediation of existing impacts to soil and groundwater is to be accomplished (i.e. summarize remedial action plan). Provide a brief narrative description including: technical justification, schedule for implementation, estimated time to attain NFA status, plus plans and specifications for the selected remedial action technology.

All impacted material associated with Rem #20584 will be removed through excavation. During the spring of 2022 Caerus plans to excavate and landfarm all hydrocarbon impacted material onsite. All previously delineated impacted material will be removed both vertically and laterally. All sidewalls and floors of the excavation will be cleared through laboratory analytical results. All excavated soil removed from the subsurface will be spread out on the working pad surface in a bermed secondary containment to be landfarmed. Since the main contaminants of concern (COC) are TPH, BTEX, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, this remediation strategy should allow for the hydrocarbons which are entrained into the native soil to volatilize thus remediating the soil to compliance with COGCC RSSLCs. All impacted soil will be remediated as stated above until laboratory analysis of the soil contained within the landfarm indicated that the soil complies with the reduced suite of analyses listed on the RSSLC Table 915-1.
