COMMENTS:

TEP Rocky Mountain LLC (TEP) requests a design change to the Federal RG 13-7-297 wellbore. TEP's proposal with respect to well design, encompasses drilling a 17-1/2" surface section to approximately 1417' MD and running 13-3/8" surface casing to ~200' TVD above the dissolution loss zone. This would enable TEP to set this surface casing and establish effective cement returns to surface remedial operations. That would provide a competent surface shoe in place as well as the option to nipple up the BOP for a secure air drilled intermediate section through the highly fractured dissolution zone. The 12-1/4" intermediate section would be drilled to approximately 3323' MD (500' TVD into Wasatch) followed by running 9-5/8" 36# J-55 intermediate casing - functioning as a fracture gradient isolation string. The purpose of cement for the 9-5/8" intermediate string is to provide sufficient drilling mud weight at TD for the following production section and TOC is planned to be 500' MD above the Wasatch formation and utilizing 50% excess with a single stage slurry.

Hole design:

Surface hole size - 17.5" to 200' TVD above Dissolution Surface

Surface casing - 13.375", J-55, BTC, 54.5#

Intermediate hole size - 12.25" to TD 500' TVD into the Wasatch

Intermediate casing - 9.625", J-55, LTC, 36#

Cement design:

Surface Casing - 12.3# Single stage slurry with 40% excess (cement to surface)

Intermediate - Single stage slurry

12.3# Lead with TOC 500' MD above the Wasatch with 50% excess

12.8# Tail from TD to 500' MD above float shoe with 50% excess

Proposed total measured depth - 11749', TVD at proposed measured depth - 11723'

Conductor information is actual as drilled data.
