Describe what is known about the spill/release event (what happened -- including how it was stopped, contained, and recovered):

During plugging and abandonment activities at the HSR-Smolowe 9-1A wellhead, five shallow soil vapor points (SVPs) were installed in the vicinity of the wellhead. On May 18, 2022, methane was detected with field screening equipment at SVP04 and SVP05. WSP collected samples from all five SVPs using IsoTubes™ and an IsoTube™ sampling manifold in conjunction with the pump on a GEM 5000. The samples were submitted to IsoTech for gas composition analysis. Results from the gas composition analysis were received from IsoTech on June 1, 2022 and indicated the presence of a trace concentration of thermogenic gas. The results are attached to this report. An investigation into the nature and source of the soil gas is on-going. The assessment details will be summarized in a supplemental Form 27 report (Remediation No. 22828; Form 27 Initial Document No. 403020116). The topographic Site Location Map showing the geographic setting of the release is provided as Figure 1.
