

## Cheatgrass Management Plan

**Location:** Grynberg Stateline Federal 24-12-65-4-NH

**Prepared:** 7-27-22

**Re:** Field Inspection Report Doc.# 697503541

**Cheatgrass Observation:** Growth is heaviest on southern vegetated slope. Cheat grass is present on northern vegetated slope but not as dense. No cheat grass has been observed on the graded pad surface itself.

**Treatment:** CCRP consulted with a contract weed management company. Esplanade Herbicide was recommended for broad-spectrum weed control and to prevent the cheatgrass growth.

**Initial Application 2022 methodology:** Upon approval of the mitigation plan by COGCC, CCRP will hire weed spraying contractor to blanket spray the full location with Esplanade Herbicide at 3 to 3.5oz per acre to stunt the cheatgrass growth for this year. The entire fenced location will be sprayed up to and along the entire fence line, as well as along the entire lease road.

**Maintenance and Monitoring:** Going forward starting in 2023, all non-reclaimed areas will be sprayed with the same application in the Spring before cheat grass seeds to prevent any new growth. The entire disturbed location will be monitored continually for cheat grass growth, and retreated, if necessary, throughout the year.
