COMMENTS:

This well started mitigation in April 2021. The bradenhead test conducted 04/12/2021 (Form 17 doc# 402662200) reported 63 psi. Initially this well was on a monthly blowdown schedule, which was not able to mitigate the pressure. On 2/9/2022 we tied in the bradenhead to a fugitive gas destruction device near the well head. Since this time, Crestone has seen progress with this well's pressure but believes that it would benefit from an additional round of drawdown through the fugitive gas destruction device set at the wellhead. Progress can be seen in the pressure trends (charts attached). Due to liquid and gas production, there is a backpressure set to limit the liquid production. Going forward this backpressure will be adjusted to help maintain the pressure below the threshold. The bradenhead test conducted 08/19/2022 (Form 17 doc # 403145829) reporting 63 psi. Collecting a sample and flowrate were not possible due to insufficient volume of bradenhead fluid. Historic liquid samples contain elevated levels of BTEX and gasoline range hydrocarbons indicating thermogenic sourcing. (Results reported on Form 43 doc# 402738529). Samples were pulled during the last bradenhead test for analysis. Crestone is confident in the efficacy of the current mitigation program and is requesting that this mitigation plan be extended for an additional 6 months.
