COMMENTS:

Caerus Piceance LLC noted noted 521 psi as our maximum pressure seen on this well. This well also had a surface casing pressure test concern during drilling operations. It was discovered that our parasite string entry was the source of the leak located approximately 2843 ft. This 521 psi at 2843 feet represents an 18% of casing depth. Caerus would like approval to to connect BH gas to a sales line. Due to drilling activity on location, Caerus requests premission to wait until the Spring of 2023 for this work to be completed. Caerus will continue to monitor BH pressure and report any anomalous pressure spikes or change in flow characteristics. Caerus will not perform any squeeze squeeze work on this well unless we see a pressure spike or flow characteristic change that warrants offensive action.

| Engineer | Operator contacted Area Engineer and Supervisor regarding failed surface casing pressure test. Operator was instructed to file a variance for an alternate surface casing pressure test. Operator noted that the pressure was stabilized at 775 psi. Due to the alternate pressure test, the bradenhead pressure threshold will be modified to 750 psi. See COA #8 | 09/19/2022 |
