**COMMENTS:**

After a Form 17 Bradenhead Test (Doc #403190538), the Federal 11-13A (API: 05-045-14548) has been identified as having continuous flow on the bradenhead after the 30-minute blowdown test. The bradenhead test shows an initial shut-in bradenhead pressure of 195 psi with 80 psi and continuous flow at the expiration of the 30-minute blow-down. Due to the higher bradenhead shut in pressure relative to the max allowable pressure (369 psi or 30% of surface casing shoe depth), Caerus Oil and Gas proposes to utilize a pressure transducer, connected to the automation/SCADA system, which will continuously monitor bradenhead pressure and ensure it does not increase and approach the max allowable pressure. Note: pressures on the production casing string during the bradenhead blow-down test confirm casing integrity is not compromised
