TEP Rocky Mountain LLC (TEP) requests a waiver of the top of cement COA applied to the WMC 33-20 that requires cement coverage from the 4-1/2" production casing shoe to a minimum of 200 ft above the Lower Wasatch. The COGCC was notified of Low TOC prior to completions operations on 01/26/2023.

Comment on Mechanical Integrity: TEP believes that when a well has low static bradenhead pressure and adequate cement coverage above the shallowest perforation, introducing squeeze perforations above the cement top introduces risk for cross flow. Squeeze perforations are more likely to lose mechanical integrity than new casing over the life of the well due to normal operations. Unless there are sources of bradenhead pressure behind the casing to attempt to eliminate, TEP does not encourage compromising the mechanical integrity of new casing by creating cement perforations. Top of Cement is 7,543 ft, and top of planned top perforation is 9,030 ft. TEP has 1,487 ft of cement over the top perforation, which we believe to be adequate cement over the top perforation. Our recommendation would be to not remediate low TOC for this well. If we experience an increase in bradenhead pressure, we will address the issue accordingly, which may include remediation. The attached Form 17 Braden Test Report conducted on 01/25/2023 resulted in no flow and 0 psi of pressure.
