RESUME

OPERATOR: Conoco, Inc.

WELL NAME & NUMBER: State 16 #1

LOCATION: NW, NW, Section 16, Township 36 South,  
Range 56 West

AREA: Big Beaver Field

COUNTY: Washington

STATE: Colorado

ELEVATION: 4695' GL and 4705' KB (estimate)

ENGINEER: Manuel Trevino

GEOLOGIST: Clyde Cody

SPUD DATE: March 4, 1985

COMPLETION DATE: March 26, 1985

HOLE SIZE: 12 1/2" to 597', 7 7/8" 597' to TD

CASING: 9 5/8" to 597'

CEMENTING: Halliburton

CONTRACTOR: Exeter Drilling Company

EQUIPMENT: Rig #22

TOOLPUSHER: Gordon Rammage

DRILLERS: Poos, Leghman, Padilla, Robertson

DRAWWORKS: 6-15

DERRICK: Lee C. Moore

PUMP: Continental Emsco D-500 & D-300

DRILL COLLARS: 18-2 1/4" ID, 6 1/4" OD 556'

DRILL PIPE: 4 1/2" 16-60

DRILLING MUD: Dresser Magobar

MUD TYPE: Clear water to 4104', Lightly dispersed  
chemical mud to TD

MUD ENGINEER: Rudy Swingle

RESUME cont'd.

MUDLOGGING: Columbine Logging, Inc.

TYPE UNIT: Baseline FID total gas analyzer and chromatograph

ENGINEERS: J. Daniel Brookshire and Cecilia Garland

ELECTRIC LOGS: Schlumberger

TYPE LOGS: DLL-MLL-GR w/caliper surface casing to TD,  
BHC-AL-GR w/caliper surface casing to TD  
and CDL-CNL-GR w/caliper 4500' to TD

TOTAL DEPTH: 8663'

DRILLING TIME: 22 days

BOTTOM FORMATION: PreCambrian

WELL STATUS: Plugged and Abandoned

## SUMMARY AND CONCLUSIONS

The Conoco Inc. 16 #1 State was drilled off spacing in the Big Beaver Field to a total depth of 8663'. Its purpose was to evaluate the Permian Lyons sandstone, Pennsylvanian and Mississippian formations for hydrocarbon production, with the intent to drill to Basal Precambrian.

The first shows were encountered in the Lower J sandstone. The sands had traces of black oil stain with a weak crushed cut. The gas kick in the zone had higher C<sub>3</sub> readings than C<sub>2</sub>, which can indicate a water flushed zone. The Lower J sandstone is the major producing zone of the Big Beaver Field.

A gas kick was encountered at 6020' with the gas coming up immediately following a bit trip. During the kick the samples were 98% cavings from the Niobrara. Since there was no sample show and the drill rate indicates shale and silt, the gas is believed to be from washouts in the Niobrara and not from actual formation being drilled.

The major zone of interest was the Lyons sandstone which was believed to be structurally high due to Precambrian faulting. There is evidence of faulting in the field from sands in the Muddy J formation. Due to lack of other deep wells in the area, it is unknown at this time if the Lyons sandstone was actually structurally high on the 16 #1 State. The top of the Lyons sand was encountered at 6222' and was 62' low to prognosis. We drilled 38' of sand and the bottom became silty. There was no sample or gas show, but some very poor porosity was observed. Due to the lack of show it was decided not to test the Lyons sand. Electric logs showed much more sand than was encountered in the samples.

Oil and small gas shows were encountered in two thin limey sandstone stringers in the Virgil. The sands had weak residual ring cut and had a calcareous matrix with no visible porosity.

Abundant gas and oil shows were seen in the Missouri, Des Moines and Atoka formations. The shows were from very carbonaceous shales. These shales looked to be a very good source rock and the limestone above and below some of these shales, had very weak oil shows.

The Morrow formation, one of the principle objectives, was disappointing because of a lack of show but was significant because some sand was seen in the samples. The Morrow channel sands are very hard to see on seismic and are therefore important when found, especially on a wildcat well with no control.

The Mississippian formation showed little interest. All that was encountered were some porosity zones with little gas shows opposite them.

SUMMARY AND CONCLUSIONS cont'd.

The Lower Paleozoics were puzzling while being drilled. What was thought to be a reverse fault that repeated the Morrow, Mississippian and Cambrian formations, was actually a great thickening of section as compared to prognosis. There was evidence of faulting at 8340' to 8360'. This took the form of slicken sides on the shale surfaces and the kelley bounced while drilling. There was good porosity on logs in the Lakota sandstone, but this zone was also wet on logs. The State 16 #1 was plugged and abandoned according to state regulations.
