**COMMENTS:**

This well surpassed the pre-stimulation threshold of 200 psi on 6/21/2023 with a pressure of 236 psi as reported on Form 17, doc# 403441322. With the verbal approval of COGCC staff, this well was tied into a frac tank onsite in order to monitor the bradenhead during the ongoing stimulation. An initial blowdown period of this well was completed and it was shut in on 6/28/2023 to monitor an approved shortened buildup of 48 hrs. After 48 hours the pressure had plateaued at 2 psi. Due to the limited build-up period and low pressure, the decision was made to keep the well shut in for the weekend. As of today, the pressure remains at 2 psi (chart attached). A sample was taken from the Shelton 3 bradenhead and compared to two nearby wells that had production samples filed with the COGCC. Results reported on Form 43, doc# 403452749. While the BH sample appears to be thermogenic, it does not match the thermogenic signature from the producing well. Given this justification, Civitas requests this well be returned to monthly monitoring and annual testing.
