COMMENTS:

On 7/27/2023, a pre frac Form 17 was completed with a beginning pressure of 84 psi and an ending pressure of 0 psi. A gas sample was collected, and those results will be submitted once the lab has finished their analysis. Pressure is currently at 230 psi and climbing. Due to the current pressure on the surface casing, we would like to add this well to our surface kit program. The expectation is that we have a finite volume of gas and as we bleed off pressure through our mitigation process the pressure will continue to decrease. We do not believe that we have direct communication with the producing zone as our CBL's show very good cement bonding, we will use this mitigation strategy to relieve pressure and further diagnose the source of the pressure. The surface kit will remain on location for the next 6 months and continue to be used as a mitigation strategy to maintain bradenhead pressures below the 50-psi threshold. Chevron will perform another Form 17 test on or by 2/15/2024 and a follow up Form-4 will be submitted to the ECMC.
