GEOLOGIC SUMMARY

The Baer #1 was drilled with air from under surface to total depth of 2625', 145' into the Entrada Formation with air. Slight shows of gas were encountered at 1781' and 1812' on connections in the Dakota formation and at 2123' in the Morrison formation. No water was encountered in the Entrada formation.

RE: T John Baer Well #1
2051 FNL, 1994 FWL, Sec.6, T2N, R3W, UM

Dear Walter,

The referenced well reached TD of 2640 on the morning of October 31, 1978. I was present during the drilling from approximately 1250' all the way to TD. I diligently watched for any sign of gas or oil. There was none. Mr. Pease made the decision to go on to the Entrada, which was done.

Logging was performed during the afternoon of October 31 st. I obtained a preliminary copy of the electric log, and made arrangements with the Colorado Conservation Commission to plug as follows:

Plug #1 60 sacks from 2150 up to 1950 in 7 7/8" hole. This will cover the Salt Wash Sands.

Plug #2 60 sacks from 1400 up to 1200. This will block off any Dakota water flows.

Plug #3 15 sacks from 225 up to 175 which will cover the bottom of the surface pipe.

Plug #4 10 sacks cement in the surface. Total of 145 sacks. The plugging operation was accomplished during the afternoon of October 31 st.

Very truly yours,

J. N. Burkhalter
